

COS 318: Operating Systems

Synchronization: Semaphores, Monitors and Condition Variables

Jaswinder Pal Singh and a Fabulous Course Staff
Computer Science Department
Princeton University

(<http://www.cs.princeton.edu/courses/cos318/>)

Today's Topics

- ◆ Mutex Isn't Enough
- ◆ Semaphores
- ◆ Condition Variables
- ◆ Monitors
- ◆ Barriers

2

Revisit Mutex

- ◆ Mutex can solve the critical section problem
 - Acquire(lock);
 - Critical section*
 - Release(lock);
- ◆ Use Mutex primitives to access shared data structures
 - E.g. shared "count" variable
 - Acquire(lock);
 - count++;
 - Release(lock);
- ◆ Are mutex primitives adequate to solve all problems?

3

Producer-Consumer (Bounded Buffer) Problem

```

Producer:
while (1) {
  produce an item
  Insert item in buffer
  count++;
}

```

```

Consumer:
while (1) {
  remove an item from buffer
  count--;
  consume an item
}

```

count = 4

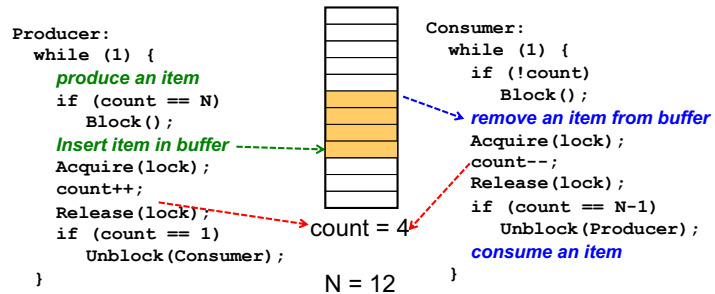

N = 12

- ◆ Can we solve this problem with Mutex primitives?

4

Use Mutex, Block and Unblock

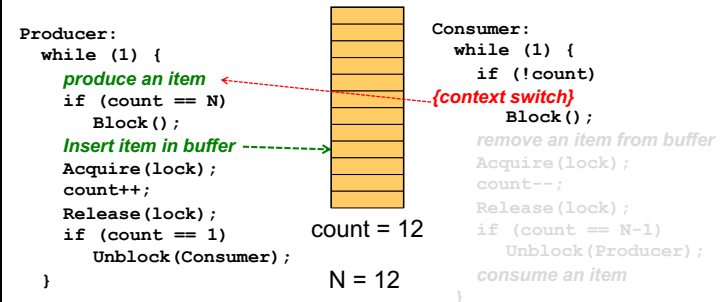

◆ Does this work?

5

Use Mutex, Block and Unblock

- ◆ Race condition!
- ◆ Ultimately, both block and never wake up
- ◆ Lost the unblock; any way to "remember" them?

6

Limitations of Locks

- ◆ Provide mutual exclusion: only one process/thread can be in the critical section at a time
- ◆ Do not provide ordering or sequencing (aka event synchronization)
 - Who gets to be in critical section first?
 - How does thread A wait for thread B (or C, D, E) to do X before A does Y?
- ◆ Need additional synchronization mechanisms
 - Semaphores
 - Condition Variables
 - Monitors
 - (Higher level constructs composed from these)

7

Semaphores (Dijkstra, 1965)

- ◆ A semaphore is a synchronization variable that contains an integer value
 - Cannot access the integer value directly (only via semaphore operations)
 - Initialized to some integer value
 - Supports two atomic operations other than initialization
 - down() (or wait() or P())
 - up (or signal() or V())
- ◆ If positive value, think of value as keeping track of how many 'resources' or "un-activated unblocks" are available
- ◆ If negative, tracks how many threads are waiting for a resource or unblock

8

Semaphores (Dijkstra, 1965)

◆ P (or Down or Wait or “Proberen” (to try)) definition

- Atomic operation
- Block version: Decrement value, and if result less than zero then block
- Spin version: Wait for semaphore to become positive and then decrement

```

P(s){
  if (--s < 0)
    block(s);
}

P(s){
  while (s <= 0)
    ;
  s--;
}
    
```

◆ V (or Up or Signal or “Verhogen” (increment)) definition

- Atomic operation
- Block version: increment, and if non-positive (which means at least one thread is blocked waiting on the semaphore) then unblock a thread
- Spin version: Increment semaphore

```

V(s){
  if (++s <= 0)
    unblock(s);
}

V(s){
  s++;
}
    
```

9

Bounded Buffer with Semaphores

```

Producer:
while (1) {
  produce an item
  P(emptyCount);

  P(mutex);
  put item in buffer
  V(mutex);

  V(fullCount);
}
    
```

```

Consumer:
while (1) {
  P(fullCount);

  P(mutex);
  take an item from buffer
  V(mutex);

  V(emptyCount);
  consume item
}
    
```

- ◆ Initialization: emptyCount = N; fullCount = 0
- ◆ Are **P(mutex)** and **V(mutex)** necessary?

Uses of Semaphores in this Example

◆ Event sequencing

- Don't consume if buffer empty, wait for something to be added
- Don't add if buffer full, wait for something to be removed

◆ Mutual exclusion

- Avoid race conditions on shared variables

11

Example: Interrupt Handler

```
Init(s, 0);
```

12

Bounded Buffer with Semaphores (again)

```
producer() {
    while (1) {
        produce an item
        P(emptyCount);

        P(mutex);
        put the item in buffer
        V(mutex);

        V(fullCount);
    }
}

consumer() {
    while (1) {
        P(fullCount);

        P(mutex);
        take an item from buffer
        V(mutex);

        V(emptyCount);
        consume the item
    }
}
```

Does Order Matter?

```
producer() {
    while (1) {
        produce an item
        P(mutex);
        P(emptyCount);

        put the item in buffer
        V(mutex);

        V(fullCount);
    }
}

consumer() {
    while (1) {
        P(fullCount);

        P(mutex);
        take an item from buffer
        V(mutex);

        V(emptyCount);
        consume the item
    }
}
```

Another Example: Are Locks Enough?

- ◆ A lock provides mutual exclusion to the shared data
- ◆ Rules for using a lock:
 - Always acquire before accessing shared data structure
 - Always release after finishing with shared data
 - Lock is initially free.
- ◆ Simple example: a synchronized queue

```
bool tryInsert()
{
    lock.Acquire(); // lock before use
    ... put item on queue; // ok to access
    lock.Release(); // unlock after done
    return success;
}
```

```
bool tryRemove()
{
    ...
    lock.Acquire();
    if something on queue // can we wait?
        remove it;
    lock->Release();
    return success;
}
```

Condition Variables

- ◆ Make `tryRemove` wait until something is on the queue?
 - Can't just sleep while holding the lock
 - Key idea: make it possible to go to sleep inside critical section, by atomically releasing lock at same time we go to sleep.
- ◆ **Condition variable:** enables a *queue* of threads waiting for something inside a critical section.
 - **Wait()** --- Release lock, go to sleep, re-acquire when woken
 - release lock and going to sleep is *atomic*
 - **Signal()** --- Wake up a waiter, if any
 - **Broadcast()** --- Wake up all waiters

Synchronized Queue

- ◆ **Rule:** must hold lock when doing condition variable operations

```
AddToQueue()
{
    lock.acquire();

    put item on queue;
    condition.signal();

    lock.release();
}
```

```
RemoveFromQueue()
{
    lock.acquire();

    while nothing on queue
        condition.wait(&lock);
        // release lock; got to
        // sleep; reacquire lock
        // when woken

    remove item from queue;
    lock.release();
    return item;
}
```

Condition variable design pattern

```
methodThatWaits() {
    lock.acquire();

    // Read/write shared state

    while (!testSharedState()) {
        cv.wait(&lock);
    }

    // Read/write shared state

    lock.release();
}
```

```
methodThatSignals() {
    lock.acquire();

    // Read/write shared state

    // If testSharedState is now true
    cv.signal(&lock);

    // Read/write shared state

    lock.release();
}
```

Condition variables

- ◆ ALWAYS hold lock when calling wait, signal, broadcast
 - Condition variable is synchronization FOR shared state
 - Remember: ALWAYS hold lock when accessing shared state
- ◆ Unlike semaphore, condition variable is memory-less
 - If signal when no one is waiting, no op
 - If signal after a wait is posted, a waiter wakes up
- ◆ Wait atomically releases lock

Structured synchronization

- ◆ Identify objects or data structures that can be accessed by multiple threads concurrently
- ◆ Add locks to object/module
 - Obtain lock on start to every method/procedure
 - Release lock when finished
- ◆ If need to wait
 - while(needToWait()) { condition.Wait(lock); }
- ◆ If do something that should wake someone up
 - Signal or Broadcast
- ◆ Always leave shared state variables in a consistent state
 - When lock is released, or when waiting

Monitors

- ◆ Monitor definition:
 - a lock and zero or more condition variables for managing concurrent access to shared data
- ◆ Monitors make things easier:
 - “locks” for mutual exclusion
 - “condition variables” for scheduling constraints

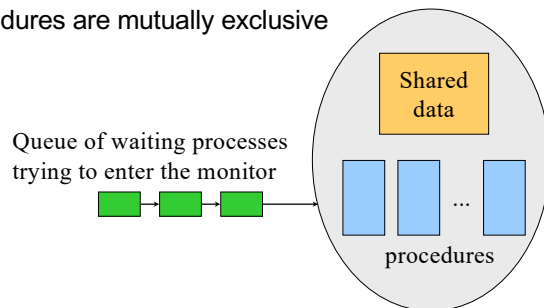

Monitors Embedded in Languages

- ◆ High-level data abstraction that unifies handling of:
 - Shared data, operations on it, synchronization and scheduling
 - All operations on data structure have single (implicit) lock
 - An operation can relinquish control and wait on condition
- ```
// only one process at time can update instance of Q
class Q {
 int head, tail; // shared data
 void enqueue(v) { locked access to Q instance }
 int dequeue() { locked access to Q instance }
}
```
- Java from Sun; Mesa/Cedar from Xerox PARC
- ◆ Monitors are easy and safe
  - Compiler can check, lock is implicit (cannot be forgotten)

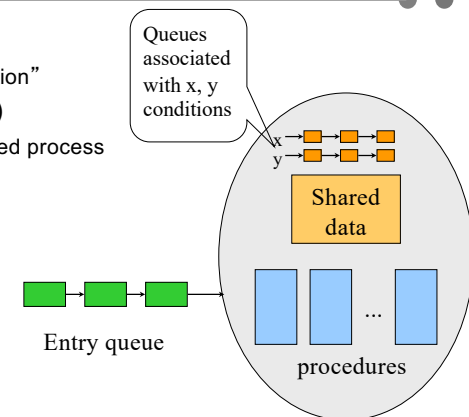

## Monitor: Hide Mutual Exclusion

- ◆ Brinch-Hansen (73), Hoare (74)
- ◆ Procedures are mutually exclusive

## Condition Variables in A Monitor

- ◆ Wait(condition)
  - Block on “condition”
- ◆ Signal(condition)
  - Wakeup a blocked process on “condition”

## Producer-Consumer with Monitors

```

procedure Producer
begin
 while true do
 begin
 produce an item
 ProdCons.Enter();
 end;
end;

procedure Consumer
begin
 while true do
 begin
 ProdCons.Remove();
 consume an item;
 end;
end;

monitor ProdCons
condition full, empty;

procedure Enter;
begin
 if (buffer is full)
 wait(full);
 put item into buffer;
 if (only one item)
 signal(empty);
end;

procedure Remove;
begin
 if (buffer is empty)
 wait(empty);
 remove an item;
 if (buffer was full)
 signal(full);
end;

```

## Hoare's Signal Implementation (MOS p137)

- Run the signaled thread immediately and suspend the current one (Hoare)
- What if the current thread has more things to do?

```

if (only one item)
 signal(empty);
something else
end;

```

```

monitor ProdCons
condition full, empty;

procedure Enter;
begin
 if (buffer is full)
 wait(full);
 put item into buffer;
 if (only one item)
 signal(empty);
end;

procedure Remove;
begin
 if (buffer is empty)
 wait(empty);
 remove an item;
 if (buffer was full)
 signal(full);
end;

```

31

## Hansen's Signal Implementation (MOS p 137)

- Signal must be the last statement of a monitor procedure
- Exit the monitor
- Any issue with this approach?

```

monitor ProdCons
condition full, empty;

procedure Enter;
begin
 if (buffer is full)
 wait(full);
 put item into buffer;
 if (only one item)
 signal(empty);
end;

procedure Remove;
begin
 if (buffer is empty)
 wait(empty);
 remove an item;
 if (buffer was full)
 signal(full);
end;

```

32

## Mesa Signal Implementation

- Continues its execution

```

if (only one item)
 signal(empty);
something else
end;

```

- B. W. Lampson and D. D. Redell, "Experience with Processes and Monitors in Mesa," *Communication of the ACM*, 23(2):105-117. 1980.
- This is easy to implement!
- Issues?

33

## Evolution of Monitors

- ◆ Brinch-Hansen (73) and Hoare Monitor (74)
  - Concept, but no implementation
  - Requires Signal to be the last statement (Hansen)
  - Requires relinquishing CPU to waiting signaled thread (Hoare)
- ◆ Mesa Language (77)
  - Monitor in language, but signaler keeps mutex and CPU
  - Waiter simply put on ready queue, with no special priority
- ◆ Modula-2+ (84) and Modula-3 (88)
  - Explicit LOCK primitive
  - Mesa-style monitor
- ◆ Pthreads (95)
  - Started standard effort around 1989
  - Defined by ANSI/IEEE POSIX 1003.1 Runtime library
- ◆ Java threads
  - James Gosling in early 1990s without threads
  - Use most of the Pthreads primitives

43

## Barrier Synchronization

- ◆ Thread A and Thread B want to meet at a particular point
- ◆ The one to get there first waits for the other one to reach that point before proceeding
- ◆ Then both go forward

42

## Using Semaphores as A Barrier

- ◆ Use two semaphores?

```
init(s1, 0);
init(s2, 0);
```

- ◆ What about more than two threads?

43

## Barrier Primitive

- ◆ Functions
  - Take a barrier variable
  - Broadcast to n-1 threads
  - When barrier variable has reached n, go forward
- ◆ Hardware support on some parallel machines
  - Multicast network
  - Counting logic
  - User-level barrier variables

44

## Equivalence

### ◆ Semaphores

- Good for signaling and fine for simple mutex
- Not good for mutex in general, since easy to introduce a bug with ordering against other semaphores
  - Locks are only for mutex, so clearer and less bug-prone

### ◆ Monitors

- Good for scheduling and mutex
- May be costly for simple signaling

45

## The Big Picture

|                       | OS codes and concurrent applications |                          |                |                           |
|-----------------------|--------------------------------------|--------------------------|----------------|---------------------------|
| High-Level Atomic API | Mutex                                | Semaphores               | Monitors       | Barriers                  |
| Low-Level Atomic Ops  | Load/store                           | Interrupt disable/enable | Test&Set       | Other atomic instructions |
|                       | Interrupts (I/O, timer)              | Multiprocessors          | CPU scheduling |                           |

46

## Summary

- ◆ Mutex alone are not enough
- ◆ Semaphores
- ◆ Monitors
  - Mesa-style monitor and its idiom
- ◆ Barriers

47
