5.5 Data Compression

- *introduction*
- *run-length encoding*
- *Huffman compression*
- *LZW compression*

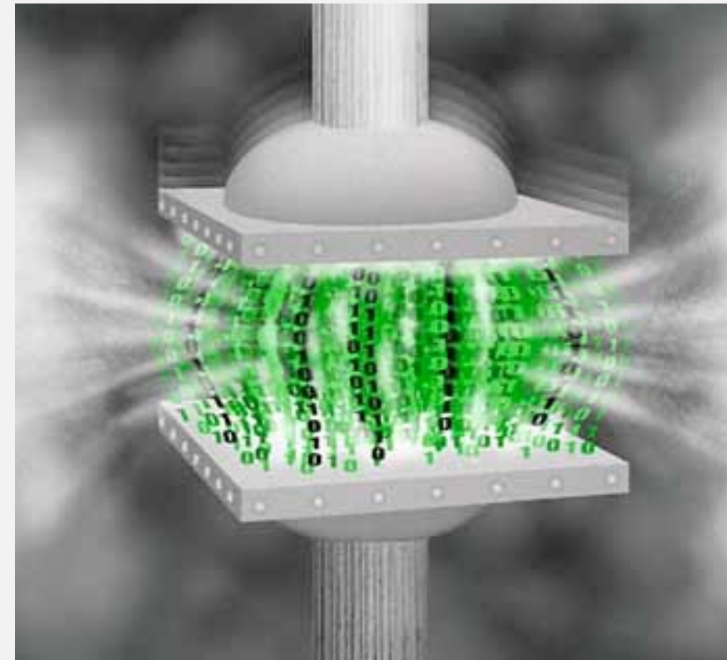
Data compression

Compression reduces the size of a file:

- To save space when storing it.
- To save time when transmitting it.
- Most files have lots of redundancy.



Who needs compression?

- Moore's law: # transistors on a chip doubles every 18–24 months.
- Parkinson's law: data expands to fill space available.
- Text, images, sound, video, sensors, ...

Every day, we create:

- 500 million Tweets.
- 300 billion emails.
- 350 million Facebook photos.
- 500,000 hours YouTube video.

Basic concepts ancient (1950s), best technology recently developed.

Applications

Generic file compression.

- Files: Gzip, bzip2, 7z, PKZIP, ...
- File systems: ZFS, HFS+, ReFS, GFS, APFS, ...

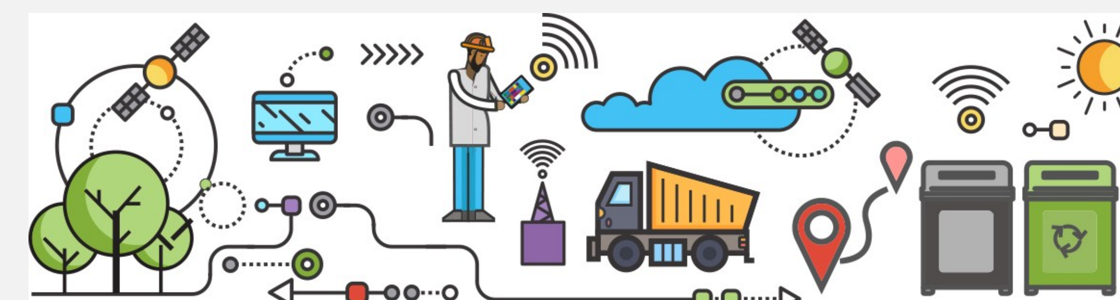
Multimedia.

- Images: GIF, JPEG, PNG, RAW, ...
- Sound: MP3, AAC, Ogg Vorbis, ...
- Video: MPEG, HDTV, H.264, HEVC, ...

Communication. Fax, Skype, WeChat, Zoom, ...

Databases. SQL, Google, Facebook, NSA, ...

Smart sensors. Phone, watch, car, health, ...



Lossless compression and expansion

Message. Bitstream B we want to compress.

Compress. Generates a "compressed" representation $C(B)$.

Expand. Reconstructs original bitstream B.

uses fewer bits (we hope)

Compression ratio. Bits in $C(B)$ ÷ bits in B.

Ex. 50–75% or better compression ratio for English language.

Data representation: genomic code

Genome. String over the alphabet `{ A, T, C, G }`.

Goal. Encode an n-character genome: `ATAGATGCATAG...`

Standard ASCII encoding.

- 8 bits per char.
- $8\,n$ bits.

char	hex	binary
'A'	41	01000001
'T'	54	01010100
'C'	43	01000011
'G'	47	01000111

Two-bit encoding.

- 2 bits per char.
- $2\,n$ bits.

compression ratio = 25% (compared to ASCII)

char	binary
'A'	00
'T'	01
'C'	10
'G'	11

	0	1	2	3	4	5	6	7	8	9	A	B	C	D	E	F
0	NUL	SOH	STX	ETX	EOT	ENQ	ACK	BEL	BS	HT	LF	VT	FF	CR	SO	SI
1	DLE	DC1	DC2	DC3	DC4	NAK	SYN	ETB	CAN	EM	SUB	ESC	FS	GS	RS	US
2	SP	!	"	#	$	%	&	'	(	)	*	+	,	-	.	/
3	0	1	2	3	4	5	6	7	8	9	:	;	<	=	>	?
4	@	A	B	C	D	E	F	G	H	I	J	K	L	M	N	O
5	P	Q	R	S	T	U	V	W	X	Y	Z	[	\	]	^	_
6	`	a	b	c	d	e	f	g	h	i	j	k	l	m	n	o
7	p	q	r	s	t	u	v	w	x	y	z	{	|	}	~	DEL

hexadecimal-to-ASCII conversion table

Fixed-length code. k-bit code supports alphabet of size 2^k.

Amazing but true. Some genomic databases in 1990s used ASCII.

Writing binary data

Binary standard output. Write bits to standard output.

public class BinaryStdOut	
`void write(boolean b)`	*write the specified bit*
`void write(char c)`	*write the specified 8-bit* `char`
`void write(char c, int r)`	*write the* `r` *least significant bits of the specified* `char`
[similar methods for `byte` *(8 bits);* `short` *(16 bits);* `int` *(32 bits);* `long` *and* `double` *(64 bits)]*	
`void close()`	*close the bitstream*

```
BinaryStdOut.write('A');
BinaryStdOut.write(false);
BinaryStdOut.write(true);
BinaryStdOut.write(15);
BinaryStdOut.write(15, 4);
BinaryStdOut.close();
```

write as 8-bit character

write bits

write 32-bit integer

write 4 least significant bits of integer

byte alignment upon close (number of bits is a multiple of 8)

01000001 01000000 00000000 00000000 00000011 11111100

'A' FT 15 15

Reading binary data

Binary standard input. Read bits from standard input.

public class BinaryStdIn

boolean	readBoolean()	*read 1 bit of data and return as a* boolean *value*
char	readChar()	*read 8 bits of data and return as a* char *value*
char	readChar(int r)	*read* r *bits of data and return as a* char *value*
[similar methods for byte *(8 bits);* short *(16 bits);* int *(32 bits);* long *and* double *(64 bits)]*		
boolean	isEmpty()	*is the bitstream empty?*

```
char c = BinaryStdIn.readChar();          // read 8-bit character
boolean b1 = BinaryStdIn.readBoolean();   // read bits
boolean b2 = BinaryStdIn.readBoolean();
int x = BinaryStdIn.readInt();            // read 32-bit integer
int y = BinaryStdIn.readInt(4);           // read 4-bit integer
```

01000001 01000000 00000000 00000000 00000011 11111100

'A' FT 15 15

Binary representation

Q. How to examine the contents of a bitstream (e.g., when debugging)?

standard character stream

```
~> more dna.txt
ATCGCA
```

bitstream represented with hex digits

```
~> java HexDump < dna.txt
41 54 43 47 43 41
48 bits
```

bitstream of binary file represented with hex digits

```
~> java HexDump < us.gif
47 49 46 38 39 61 8e 01 01 01 d5 00 00 94 18 29
06 02 03 84 29 4a 6b 18 4a 73 29 6b 6e 5d 6e 4a
45 4a f7 ef f7 42 00 52 1f 00 37 42 10 6b 31 00
63 31 08 5a 7e 70 8d 36 08 6b 4a 21 7b 5b 36 86
...
b7 de 7b f3 dd b7 df 7f 03 1e 38 cc 41 00 00 3b
99200 bits
```

lots of unprintable characters
(don't `System.out.print()` binary data)

	0	1	2	3	4	5	6	7	8	9	A	B	C	D	E	F

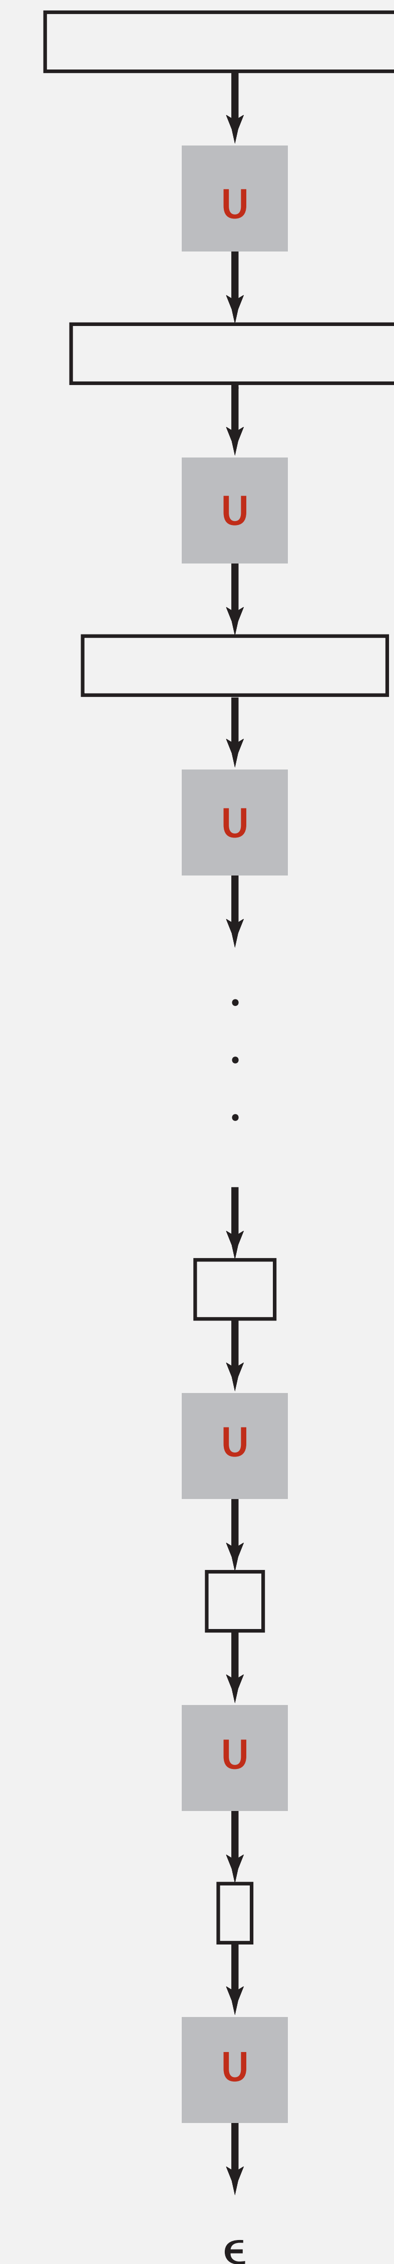
hexadecimal-to-ASCII conversion table

Universal data compression

Proposition. No algorithm can compress every bitstring.

Pf 1. [by contradiction]

- Suppose you have a universal data compression algorithm U that can compress every bitstream.
- Given bitstring B_0, compress it to get a shorter bitstring B_1.
- Compress B_1 to get a shorter bitstring B_2.
- Continue until reaching bitstring of length 0.
- Implication: all bitstrings can be compressed to 0 bits!

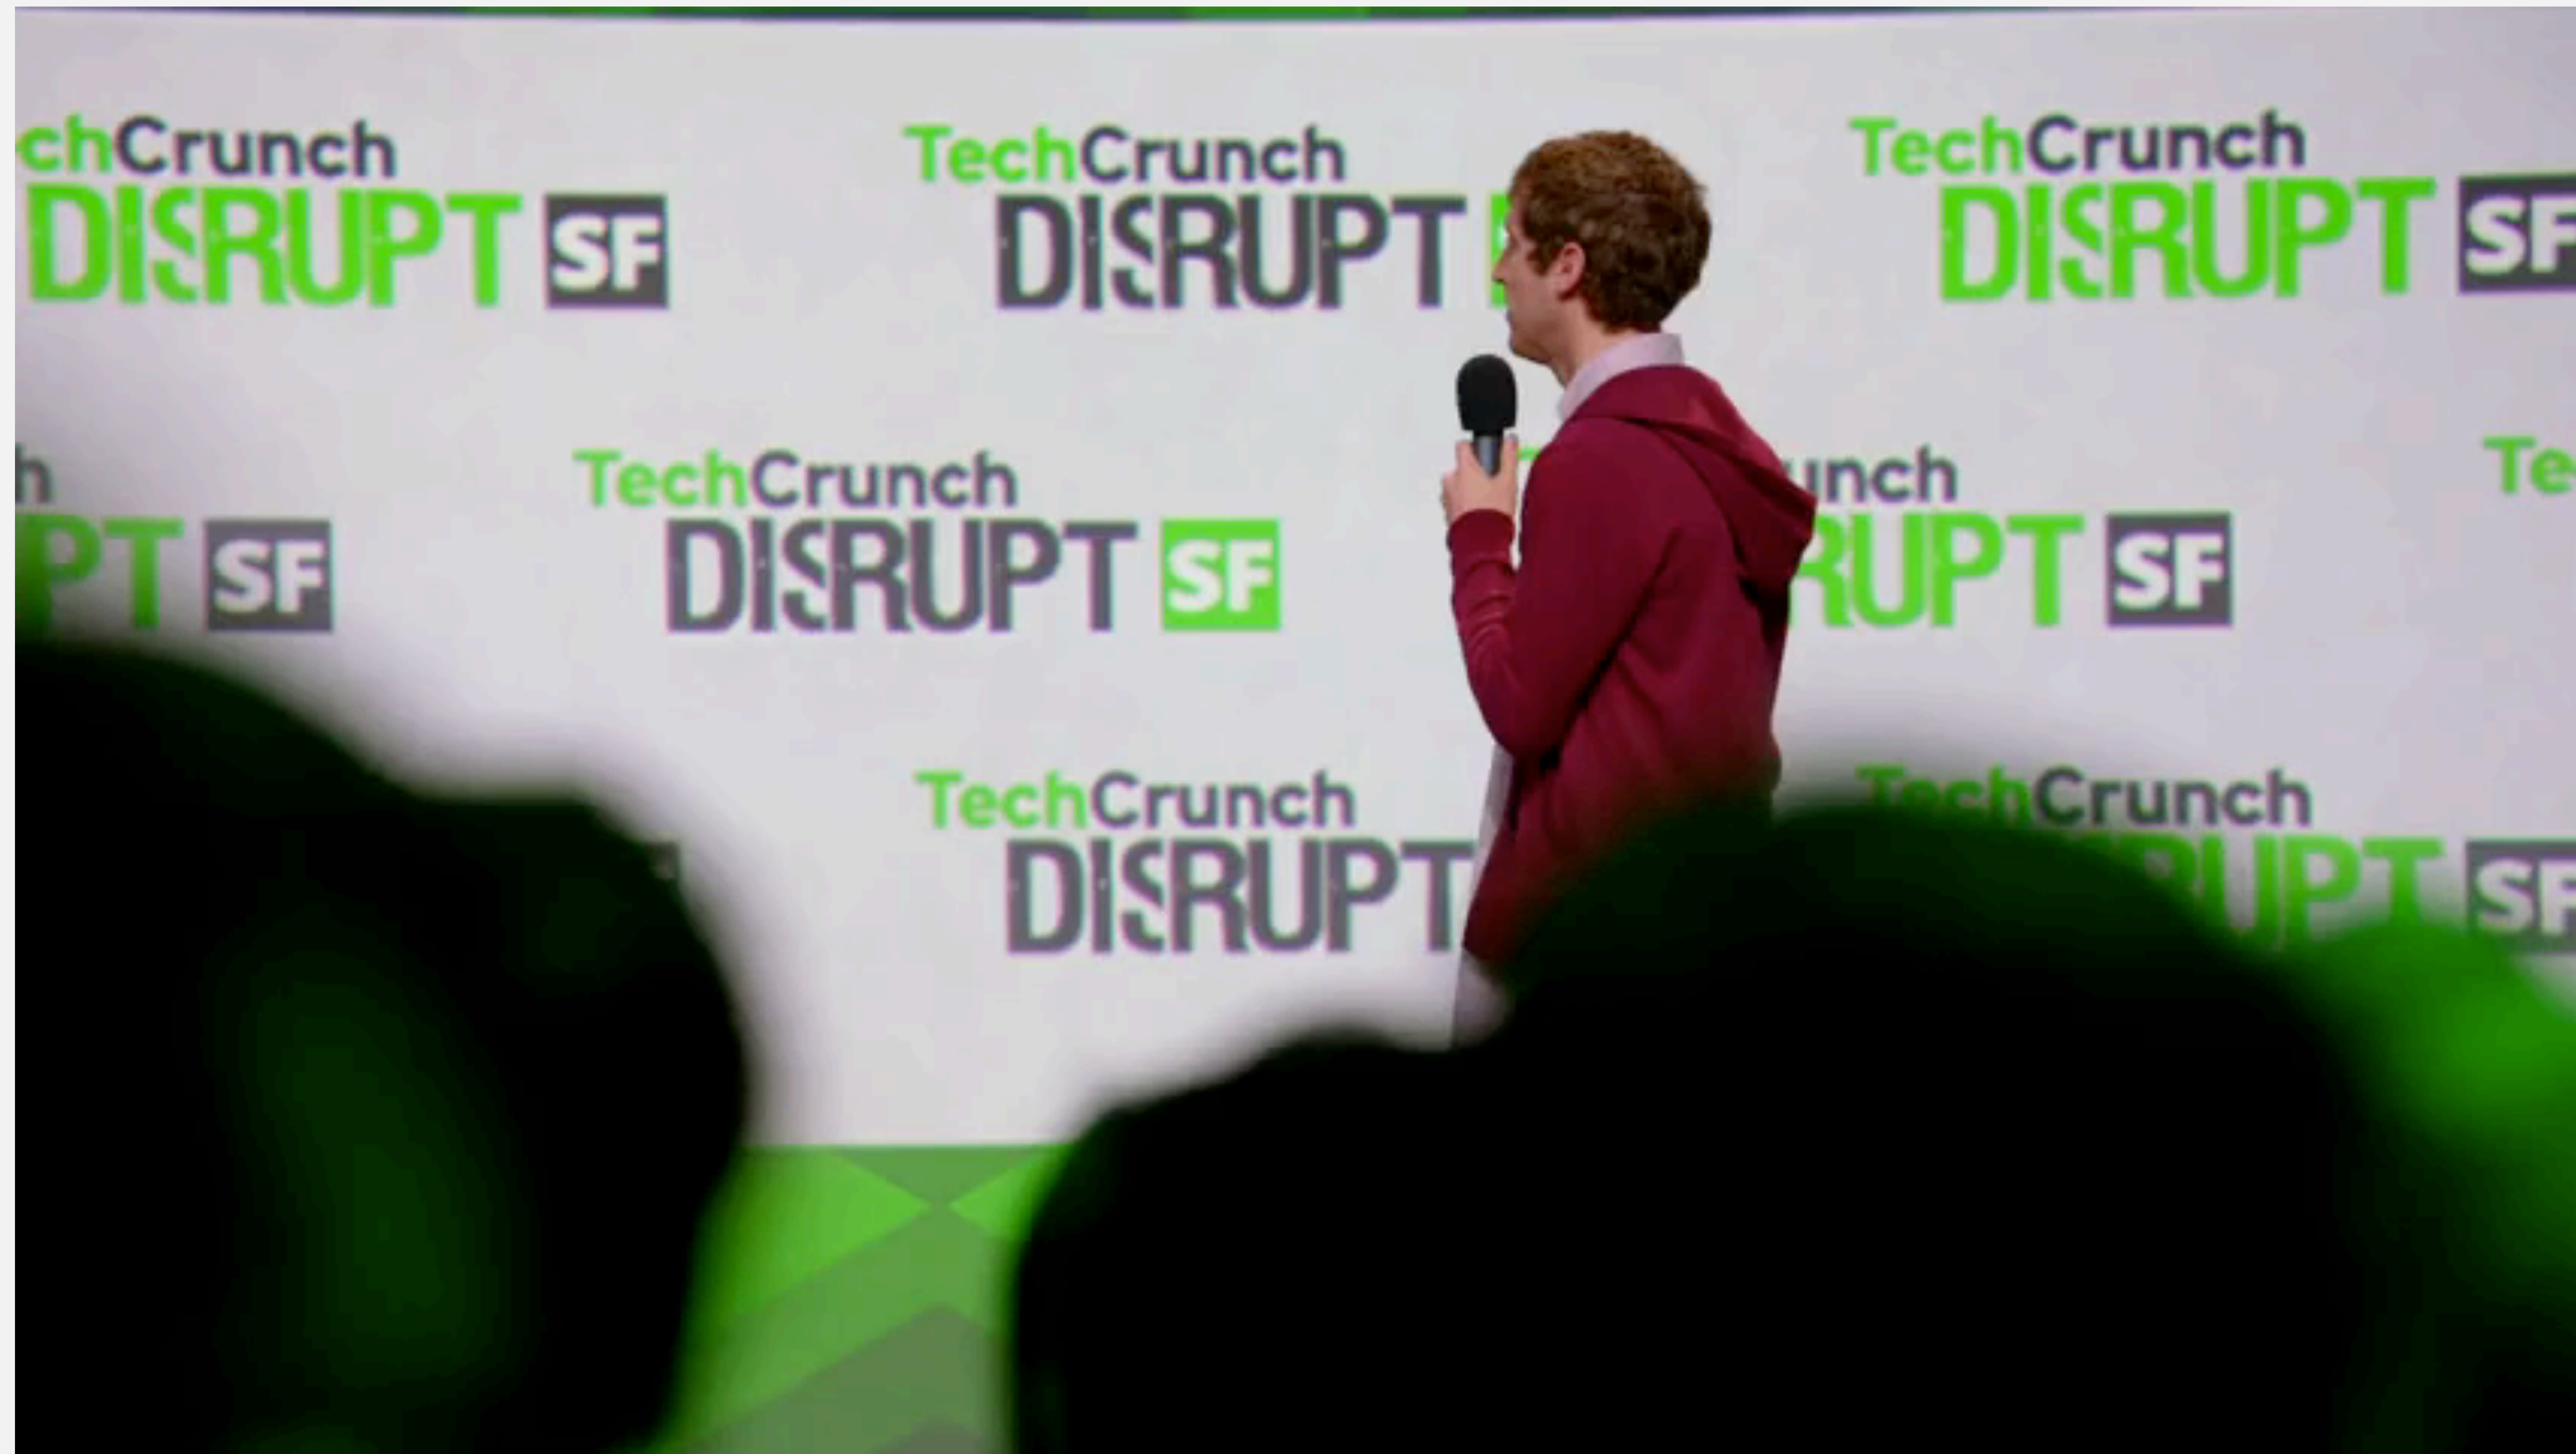


Pf 2. [by counting]

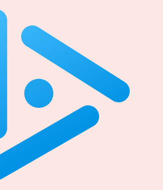
- Suppose your algorithm that can compress all $1{,}000$-bit strings.
- 2^{1000} possible bitstrings with $1{,}000$ bits.
- Only $1 + 2 + 4 + \ldots + 2^{998} + 2^{999} = 2^{1000} - 1$ can be encoded with ≤ 999 bits.
- Similarly, only 1 in 2^{499} bitstrings can be encoded with ≤ 500 bits!

Universal data compression

Pied Piper. Claims lossless compression ratio of 1 : 3.8 for arbitrary files.



Data compression: quiz 1



Did Pied Piper achieve a lossless compression ratio of 1 : 3.8 for arbitrary files?

A. Yes.

B. No.

Rdenudcany in Enlgsih lnagugae

Q. How much redundancy in the English language?

A. Quite a bit.

> " *... randomising letters in the middle of words [has] little or no effect on the ability of skilled readers to understand the text. This is easy to denmtrasote. In a pubiltacion of New Scnieitst you could ramdinose all the letetrs, keipeng the first two and last two the same, and reibadailty would hadrly be aftcfeed.* " — Graham Rawlinson

Bottom line. The gaol of data cmperisoson is to inetdify rdenudcany and epxloit it.

https://algs4.cs.princeton.edu

5.5 Data Compression

- *introduction*
- *run-length encoding*
- *Huffman compression*
- *LZW compression*

Run-length encoding (RLE)

Simple type of redundancy in a bitstream. Long runs of repeated bits.

0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 1 1 1 1 1 1 1 0 0 0 0 0 0 0 1 1 1 1 1 1 1 1 1 1 1 ← 40 bits

run of length 15 | run of length 7 | run of length 7 | run of length 11

Representation. 4-bit counts to represent alternating runs of 0s and 1s: 15 0s, then 7 1s, then 7 0s, then 11 1s.

1 1 1 1 0 1 1 1 0 1 1 1 1 0 1 1 ← now only 16 bits

15 | 7 | 7 | 11

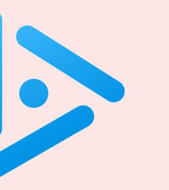
Q. How many bits r to use to store each run length?

A. Typically 8 bits (but 4 on this slide for brevity).

Q. What to do when run length exceeds max count $2^r - 1$?

A. Intersperse runs of length 0.

Applications. JPEG, TIFF, BMP, ITU-T T4 Group 3 Fax, ...



What is the best compression ratio achievable from run-length encoding when using 8-bit counts?

- **A.** 1 / 256
- **B.** 1 / 16
- **C.** 8 / 255
- **D.** 1 / 8
- **E.** 16 / 255

Run-length encoding: Java implementation

```
public class RunLength
{

   public static void compress()
   {  /* see textbook */  }

   public static void expand()
   {
      boolean bit = false;                          // initial run is of 0s
      while (!BinaryStdIn.isEmpty())
      {
         int run = BinaryStdIn.readInt(8);          // read 8-bit count from standard input
         for (int i = 0; i < run; i++)              // write run of 0s or 1s to standard output
            BinaryStdOut.write(bit);
         bit = !bit;                                // flip bit (for next run)
      }
      BinaryStdOut.close();                         // pad last byte with 0s (if needed)
   }                                                // and close output stream

}
```

https://algs4.cs.princeton.edu

5.5 Data Compression

- *introduction*
- *run-length encoding*
- *Huffman compression*
- *LZW compression*

Variable-length codes

Key idea. Use different number of bits to encode different characters.

Ex. Morse code: • • • — — — • • •

Issue. Ambiguity.

SOS ?

VZE ?

EEJIE ?

EEWNI ?

A	• —	N	— •
B	— • • •	O	— — —
C	— • — •	P	• — — •
D	— • •	Q	— — • —
E	•	R	• — •
F	• • — •	S	• • •
G	— — •	T	—
H	• • • •	U	• • —
I	• •	V	• • • —
J	• — — —	W	• — —
K	— • —	X	— • • —
L	• — • •	Y	— • — —
M	— —	Z	— — • •

codeword for S is a prefix of codeword for V

In practice. Use a short gap to separate characters.

Variable-length codes

Q. How do we avoid ambiguity?

A. Ensure that no codeword is a prefix of another.

Ex 1. Fixed-length code.

Ex 2. Append special “stop” character to each codeword.

Ex 3. General prefix-free code.

char	*codeword*
!	101
A	11
B	00
C	010
D	100
R	011

no codeword
is a prefix of another

Prefix-free codes: compression

Q. How to represent the prefix-free code for compression?

A. A symbol table or array.

char	*codeword*
!	101
A	11
B	00
C	010
D	100
R	011

key/index   value

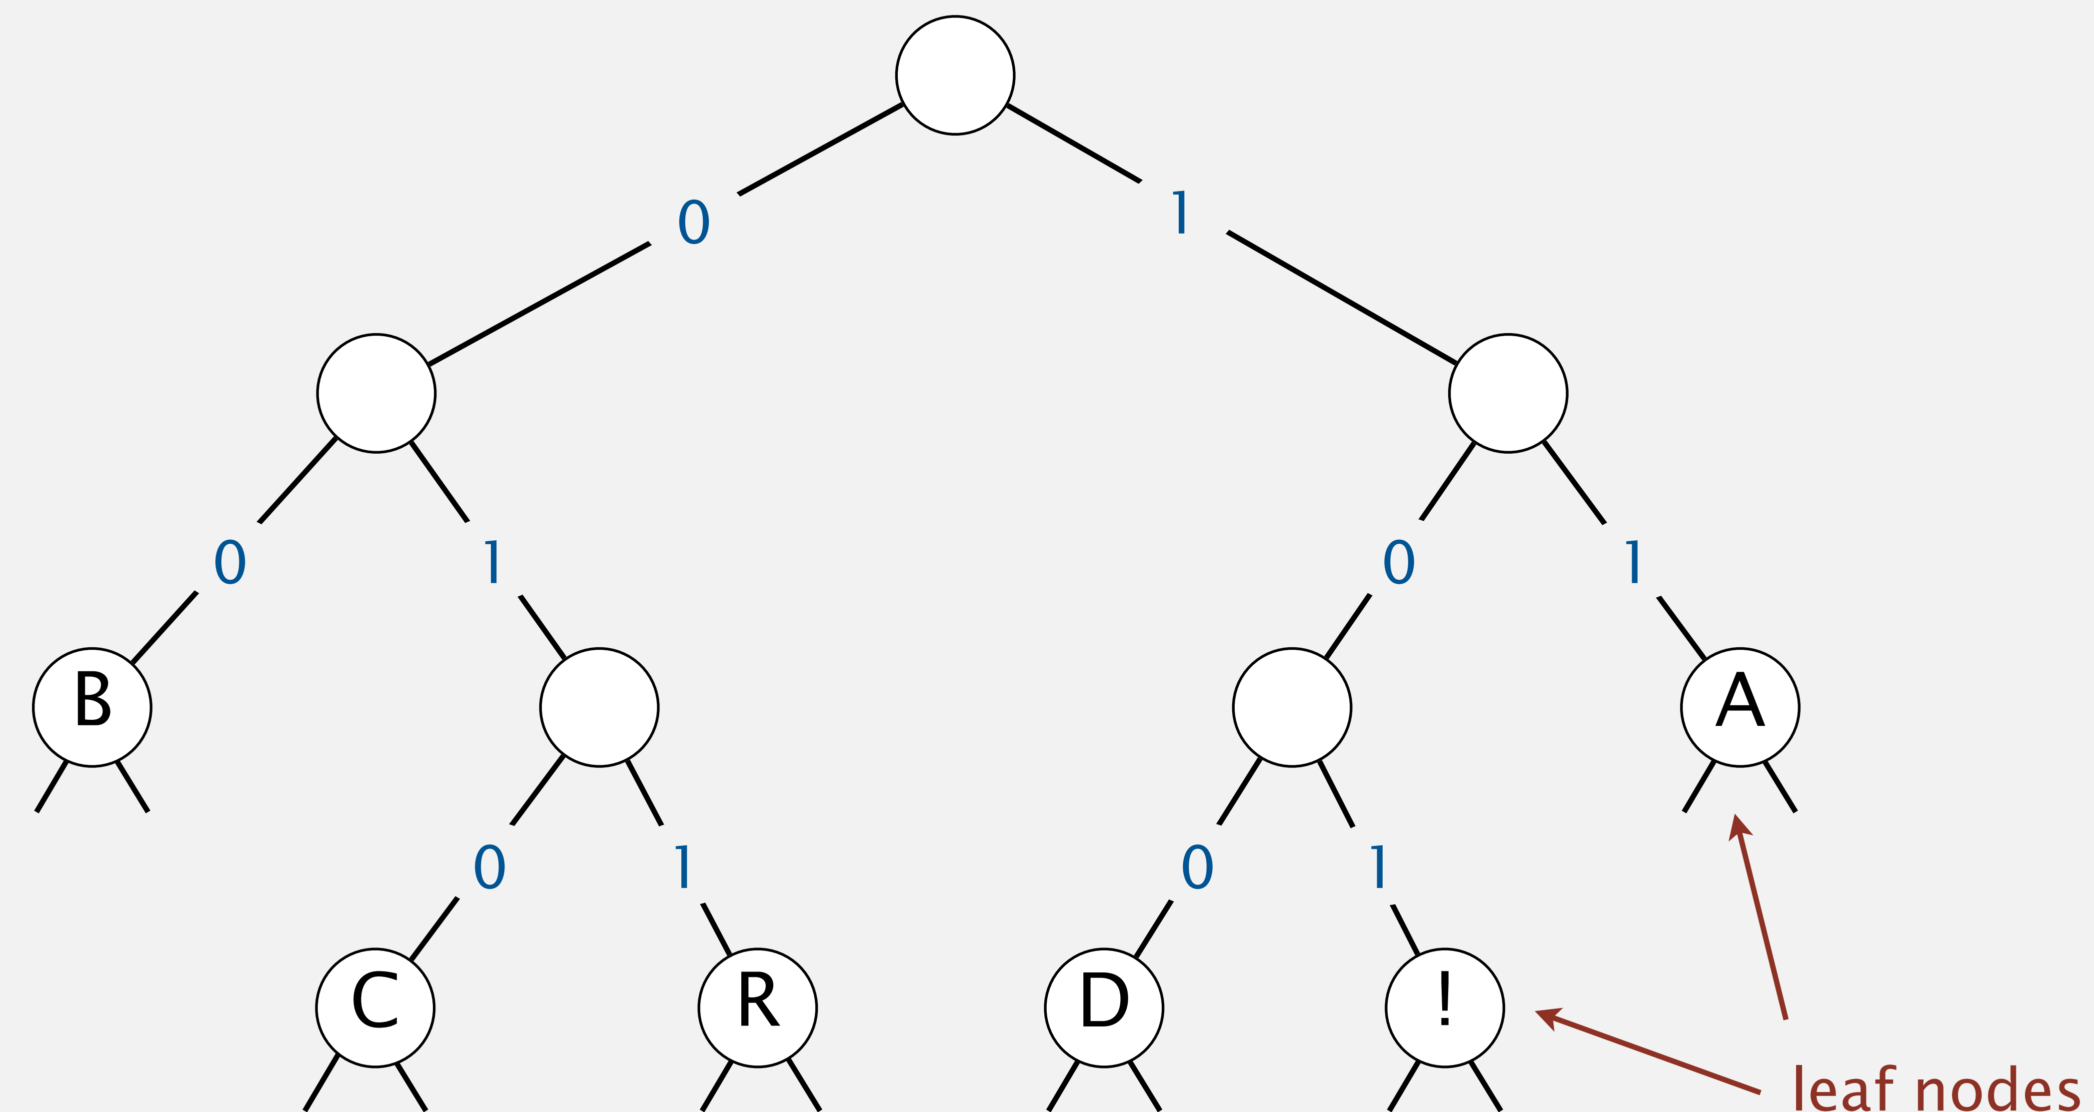
Prefix-free codes: trie representation

Q. How to represent the prefix-free code for expansion?

A. A binary trie.

- Characters in leaves.
- Codeword is path from root to leaf.

char	*codeword*
!	101
A	11
B	00
C	010
D	100
R	011



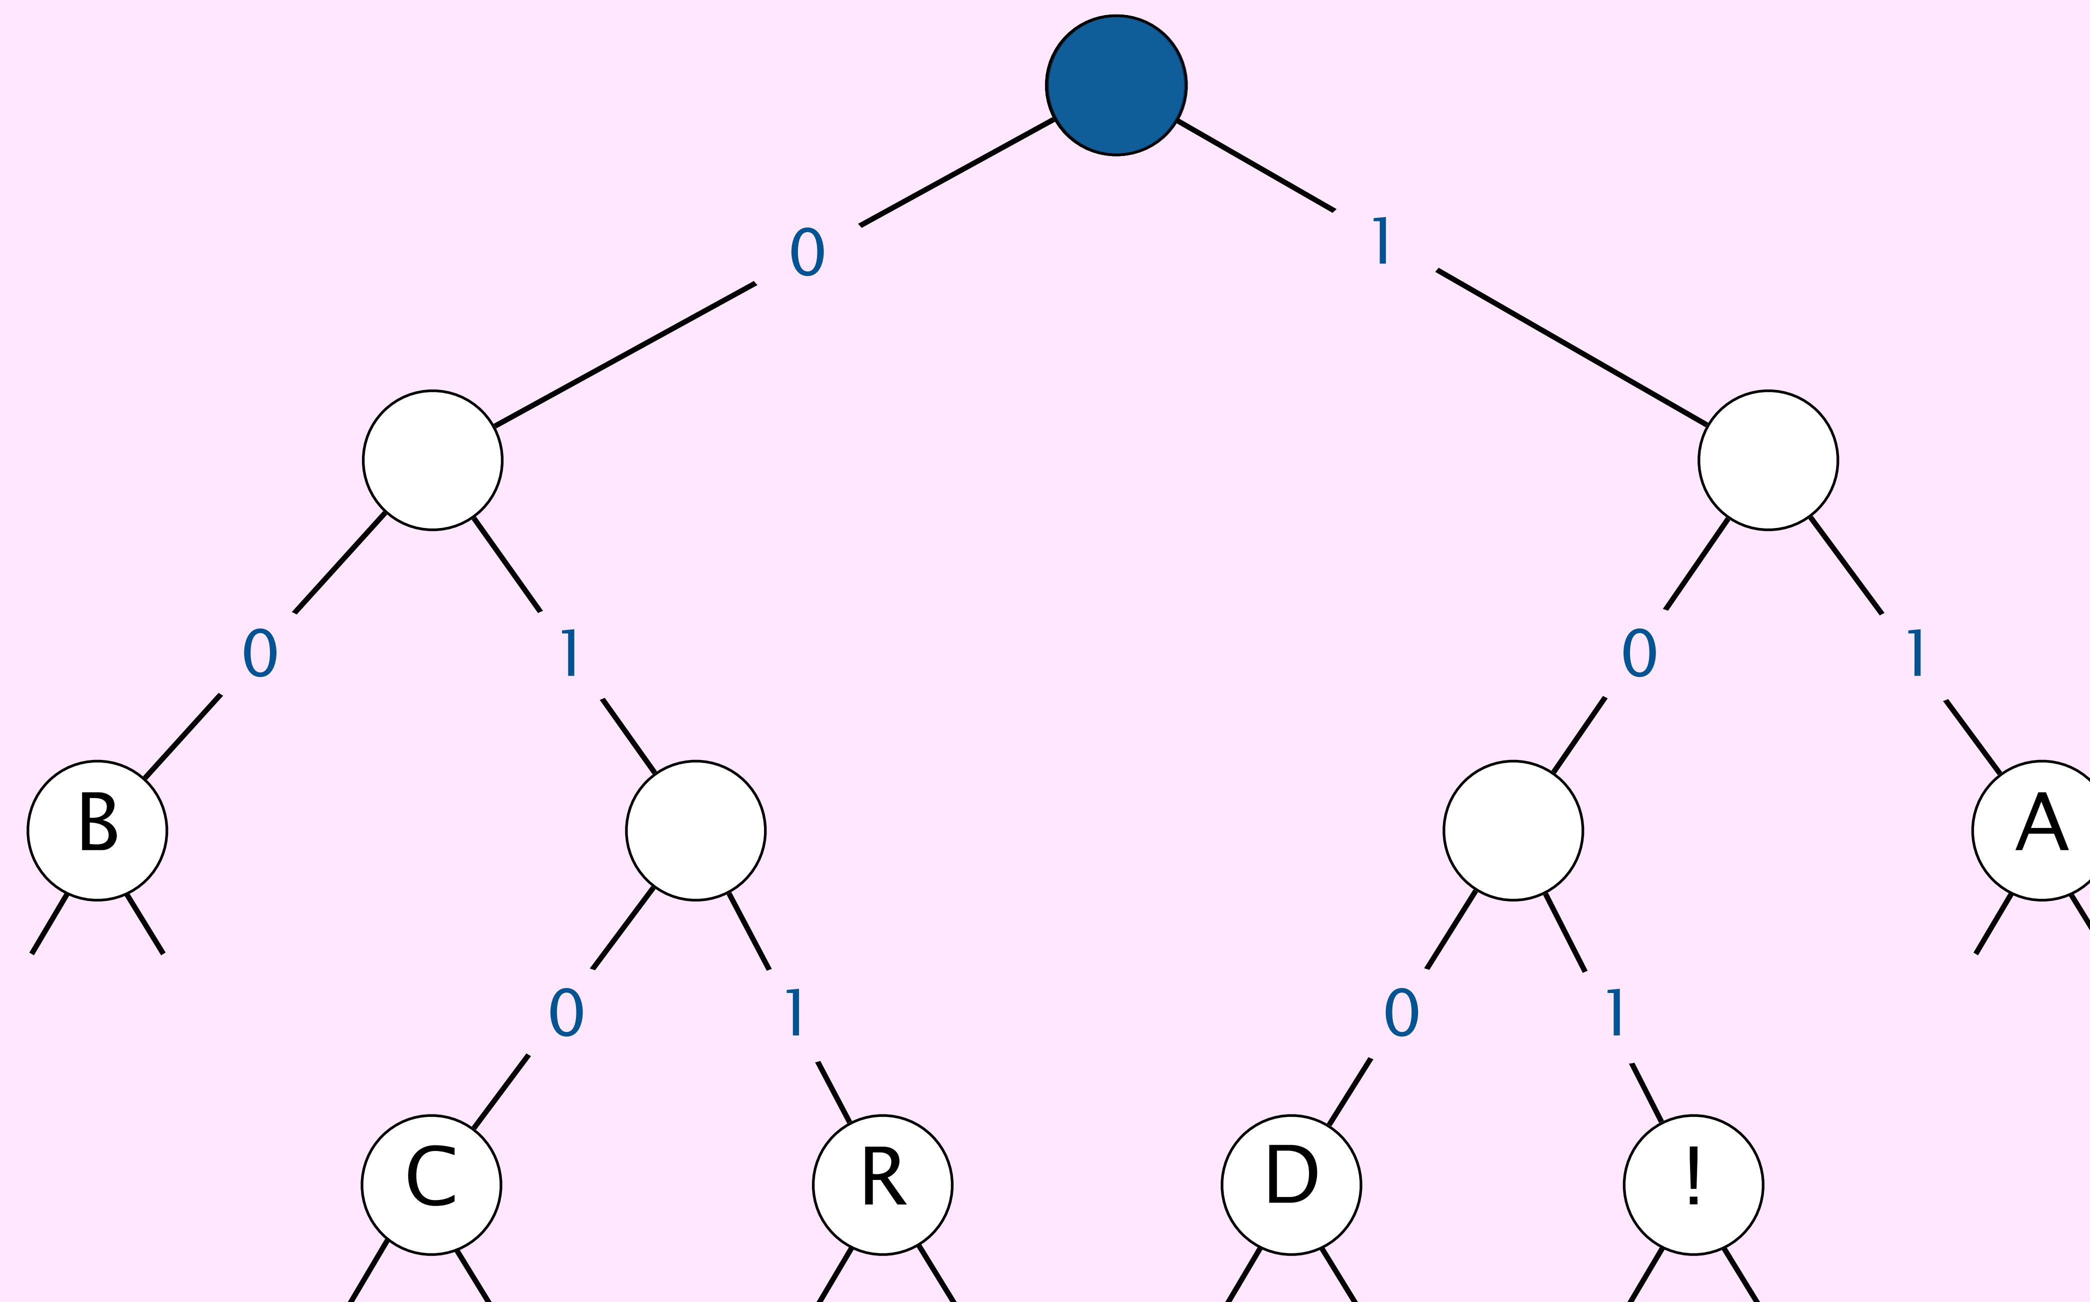
Prefix-free codes: expansion

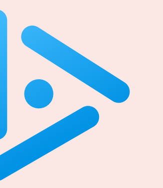
Expansion.

- Start at root.
- Go left if bit is 0; go right if 1.
- If leaf node, write character and restart at root node.

↓

1 1	0 0	0 1 1	1 1	0 1 0	1 1	1 0 0	1 1	0 0	0 1 1	1 1	1 0 1
A	B	R	A	C	A	D	A	B	R	A	!





Consider the following trie representation of a prefix-free code.

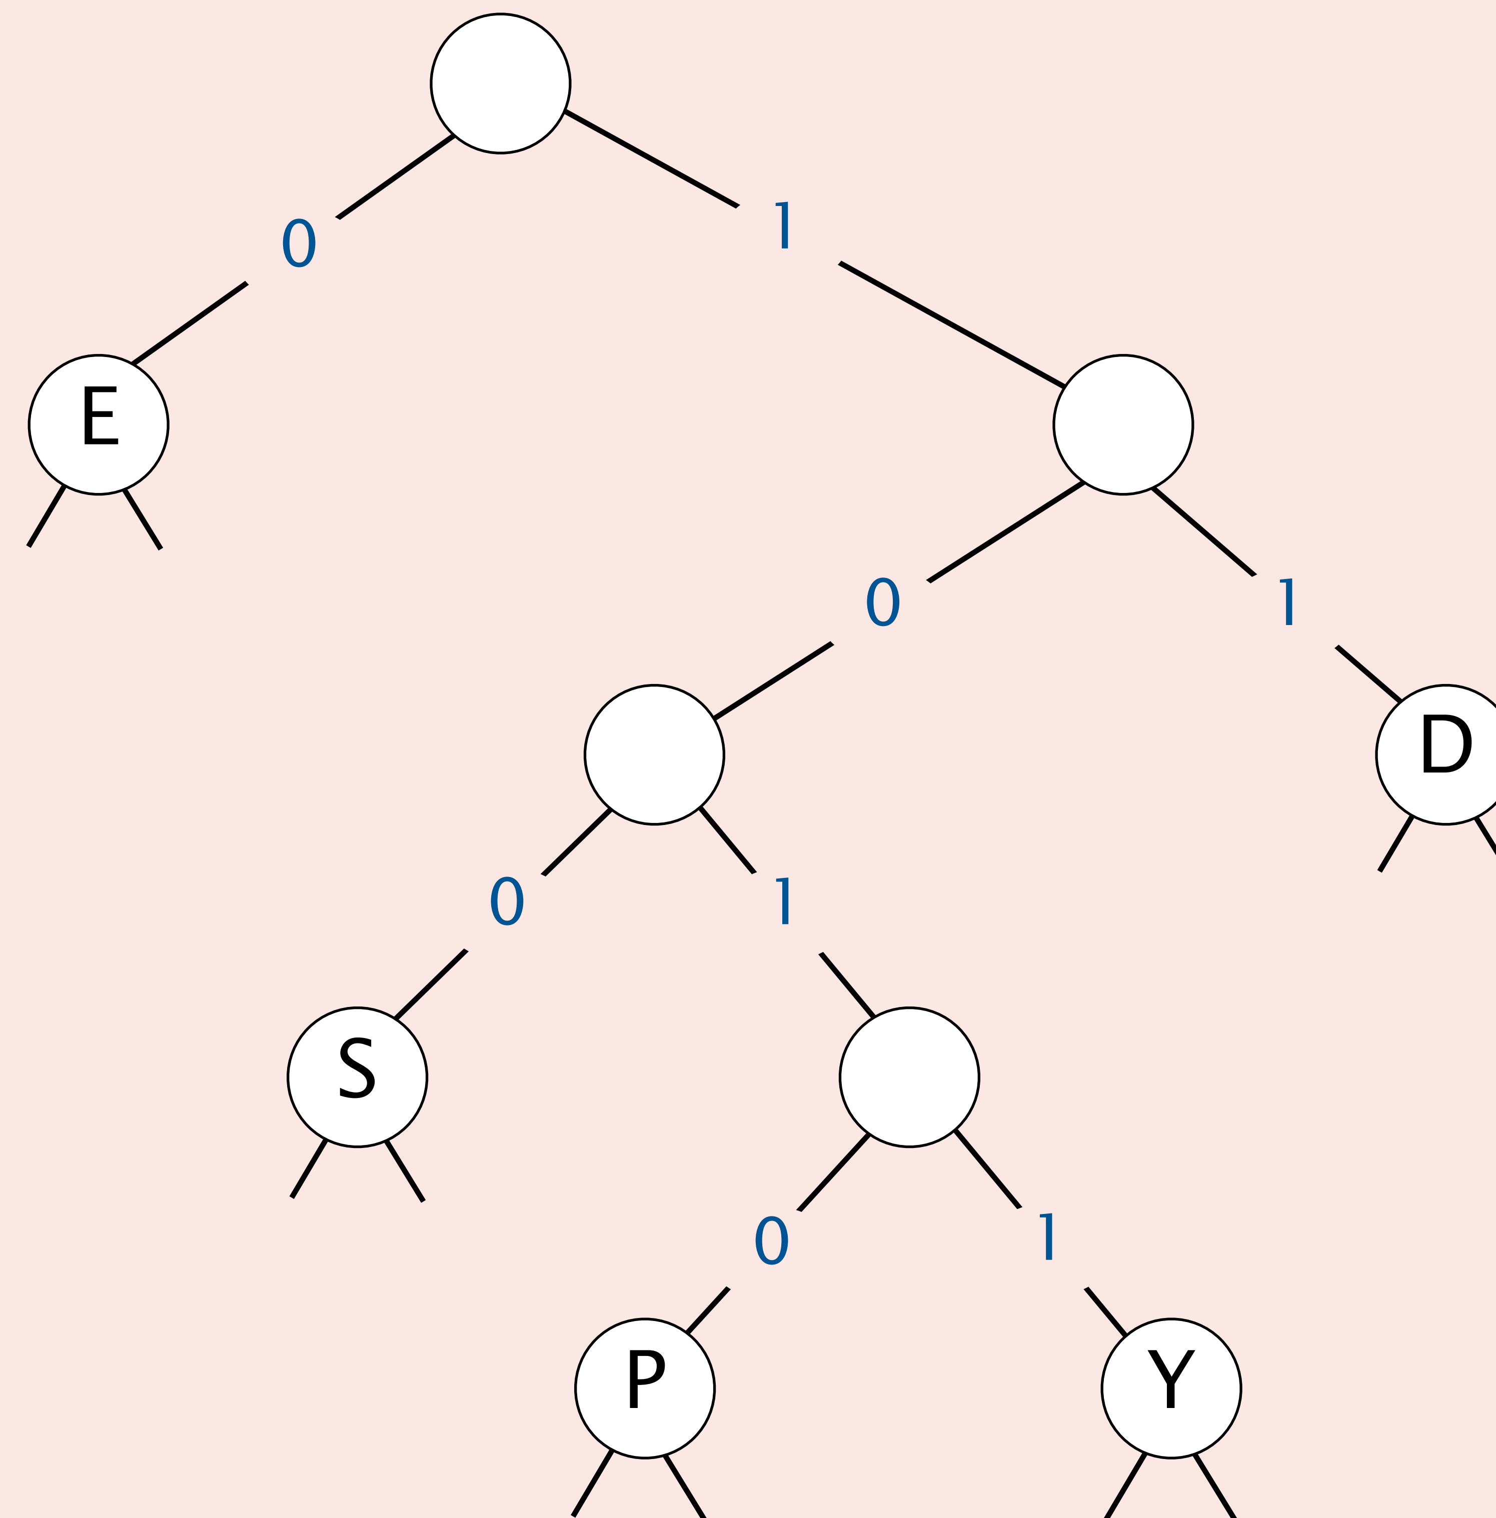
Expand the compressed bitstring 1 0 0 1 0 1 0 0 0 1 1 1 0 1 1 ?

A. PEED

B. PESDEY

C. SPED

D. SPEEDY



Prefix-free codes: expansion

```
public void expand()
{
   Node root = readTrie();                     // read encoding trie
   int n = BinaryStdIn.readInt();              // read number of encoded characters (32 bits)

   for (int i = 0; i < n; i++)                 // for each encoded character i
   {
      Node x = root;                           // follow path from root to leaf
      while (!x.isLeaf())                      // to determine character
      {
         if (!BinaryStdIn.readBoolean())       // read 0 or 1 (1 bit)
            x = x.left;
         else
            x = x.right;
      }
      BinaryStdOut.write(x.ch, 8);             // write character (8 bits)
   }
   BinaryStdOut.close();                       // don't forget this!
}
```

Running time. Linear in input size (number of bits).

Huffman compression overview

Static model. Use the same prefix-free code for all messages.

Dynamic model. Use a custom prefix-free code for each message.

Compression.

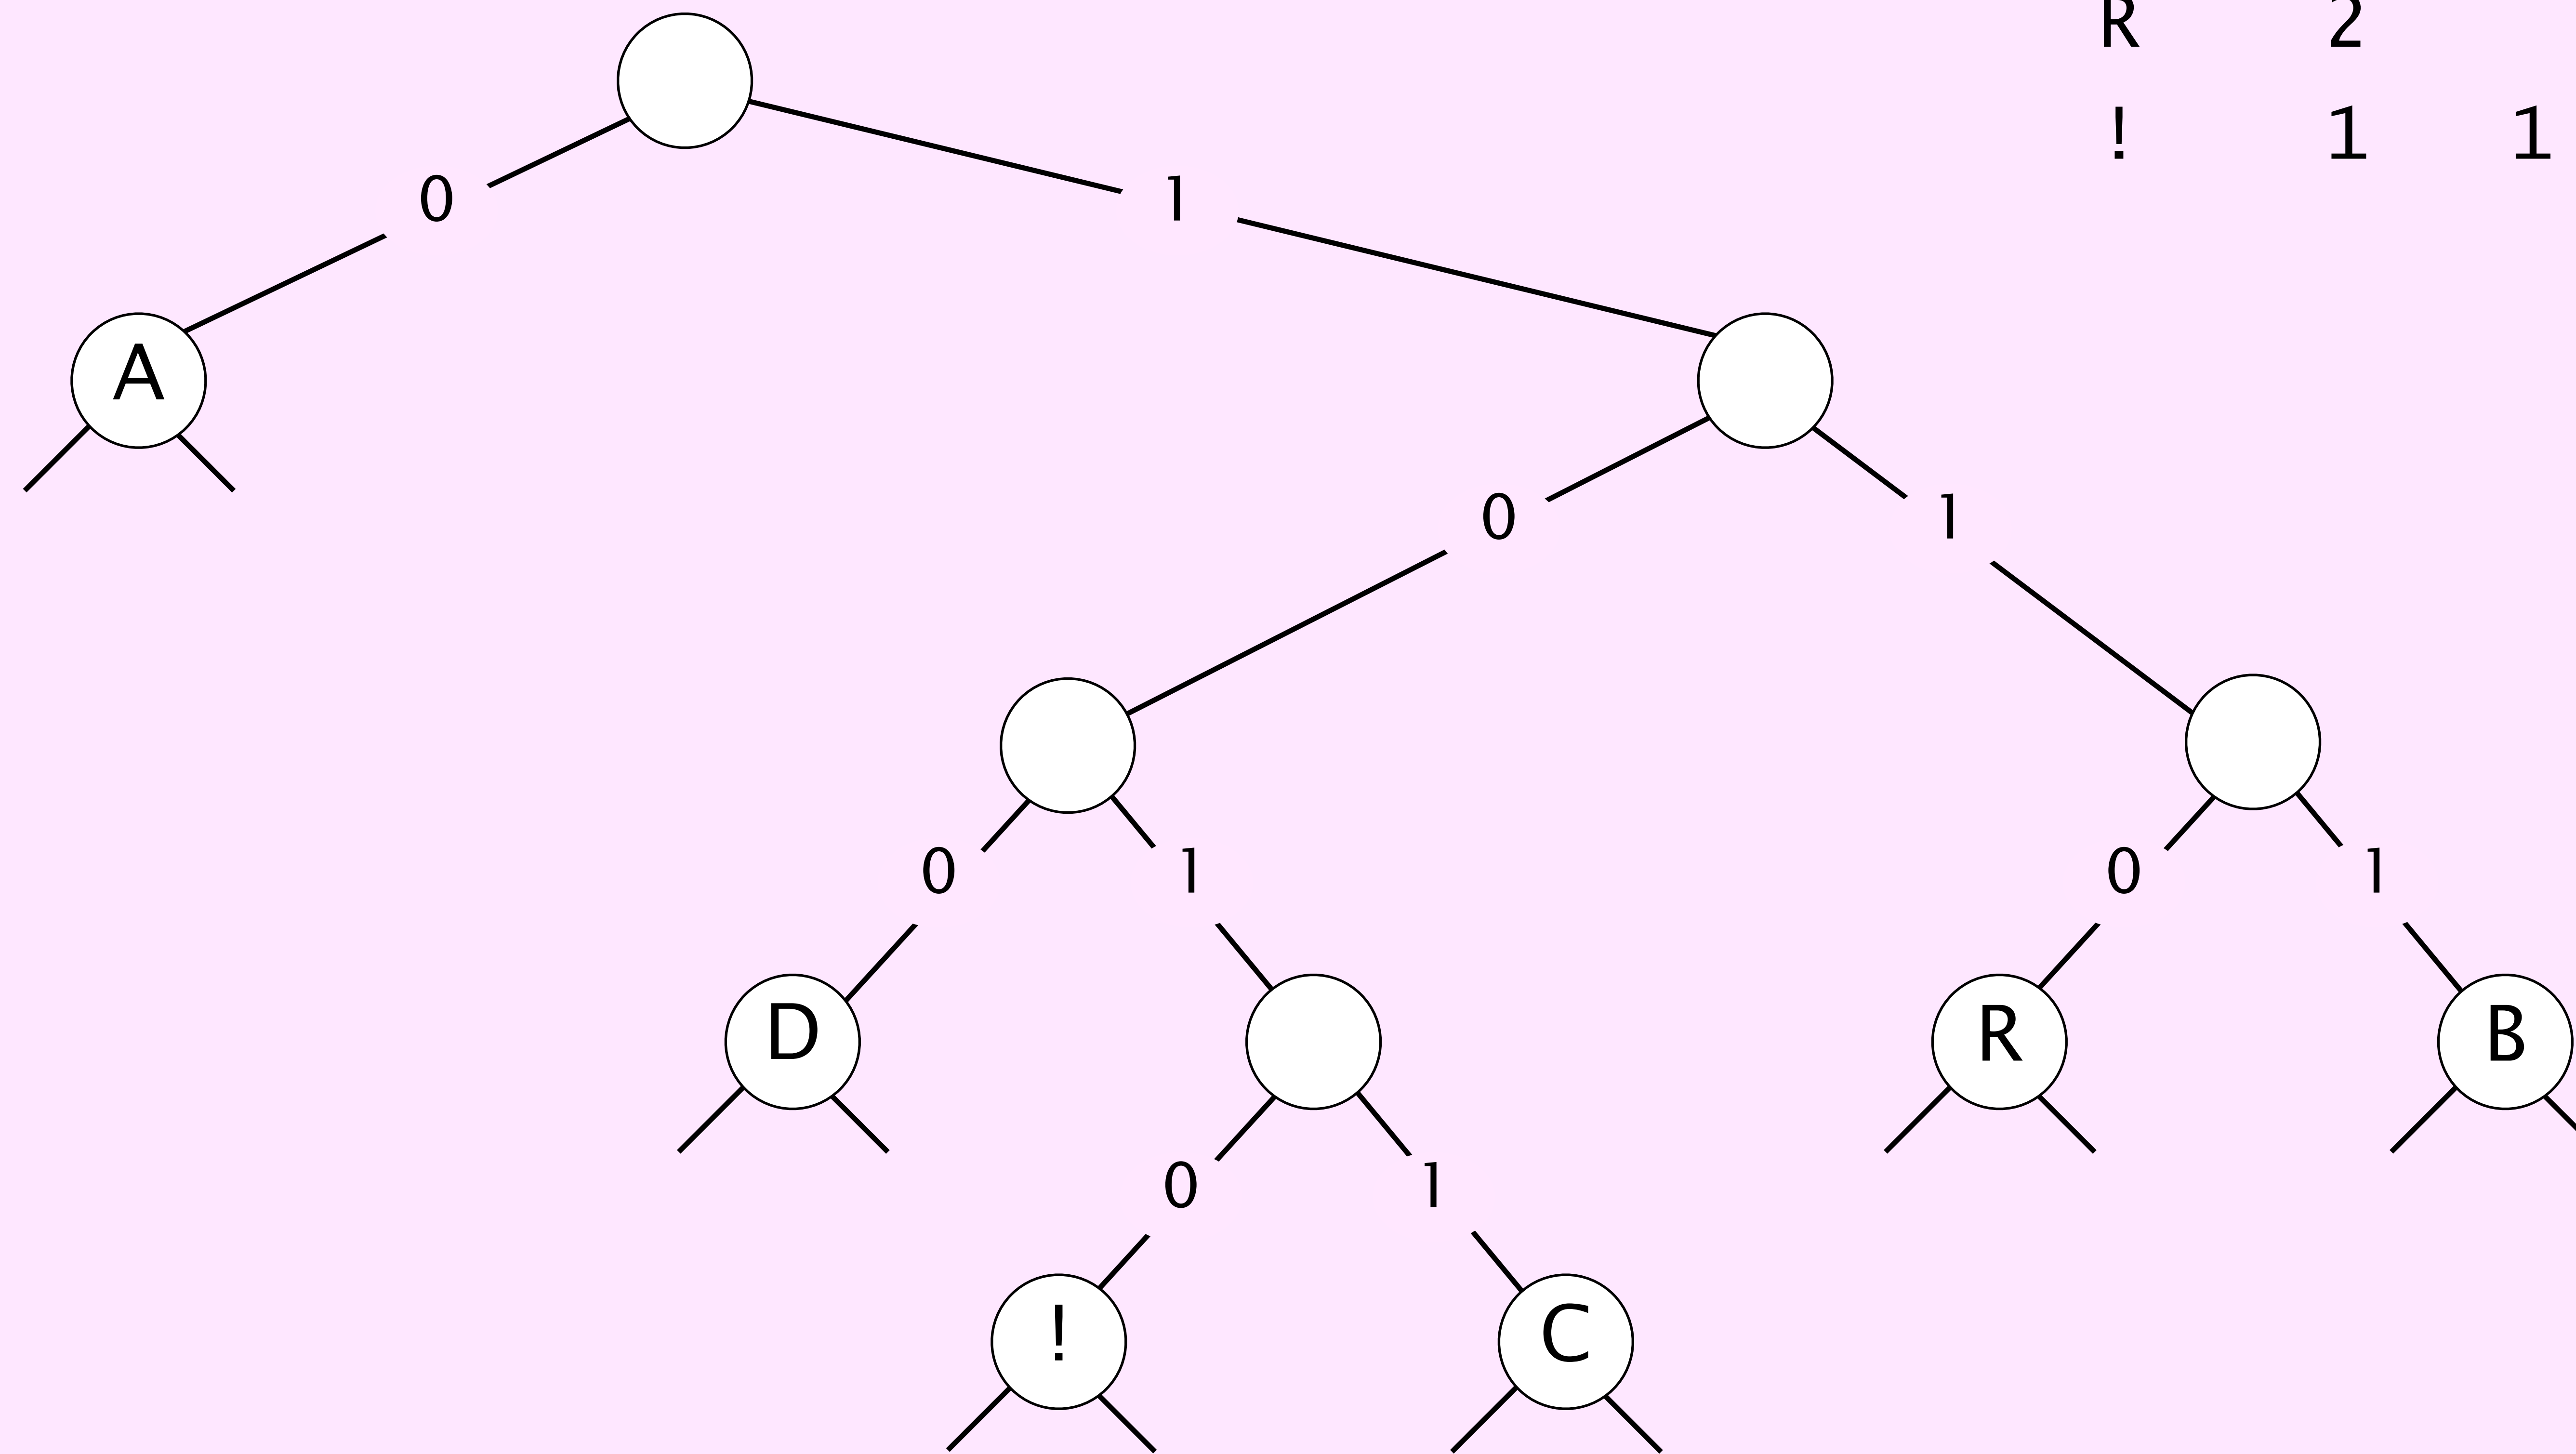
- Read message.
- Build best prefix-free code for message using Huffman's algorithm. [next]
- Write prefix-free code.
- Compress message using prefix-free code.

Expansion.

- Read prefix-free code.
- Read compressed message and expand using prefix-free code.

Huffman's algorithm demo

char	freq	encoding
A	5	0
B	2	1 1 1
C	1	1 0 1 1
D	1	1 0 0
R	2	1 1 0
!	1	1 0 1 0



Huffman's algorithm

Huffman's algorithm:

- Count frequency `freq[c]` of each character `c` in input.
- Start with one node corresponding to each character `c` (with weight `freq[c]`).
- Repeat until single trie formed:
  - select two tries with min weight `freq[i]` and `freq[j]`
  - merge into single trie with weight `freq[i] + freq[j]`

Proposition. Huffman's algorithm computes an optimal prefix-free code for a given message.

Pf. See textbook.

Applications:

Constructing a Huffman trie: Java implementation

```
private static Node buildTrie(int[] freq)
{
   MinPQ<Node> pq = new MinPQ<Node>();
      for (char c = 0; c < R; c++)
         if (freq[c] > 0)
            pq.insert(new Node(c, freq[c], null, null));

   while (pq.size() > 1)
   {
      Node x = pq.delMin();
      Node y = pq.delMin();
      Node parent = new Node('\0', x.freq + y.freq, x, y);
      pq.insert(parent);
   }

   return pq.delMin();
}
```

initialize PQ with singleton tries

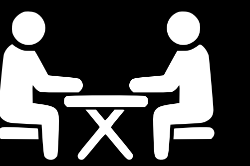
merge two smallest tries

not used for internal nodes

total frequency

two subtries

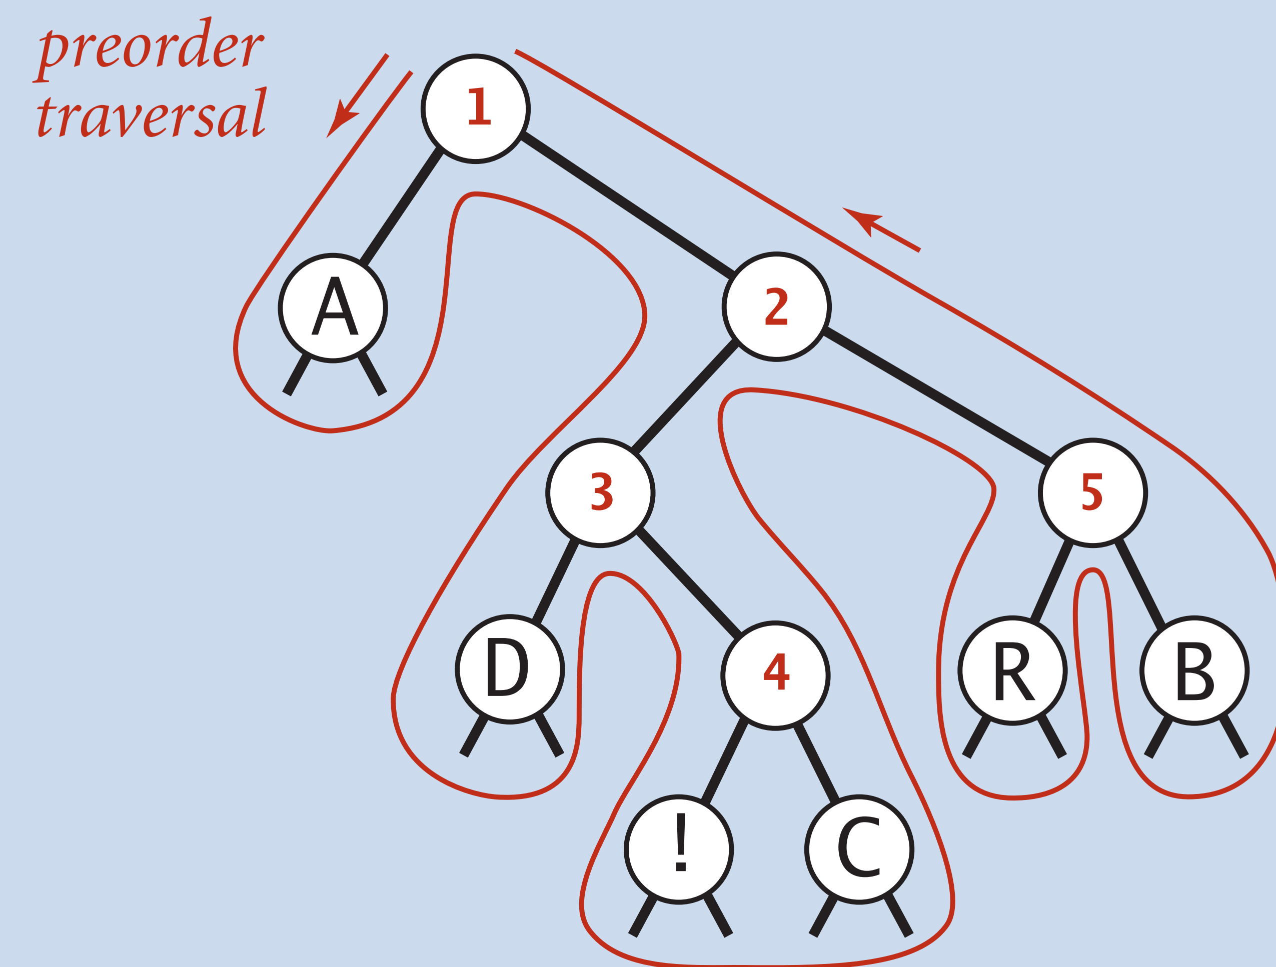
Encoding the binary trie

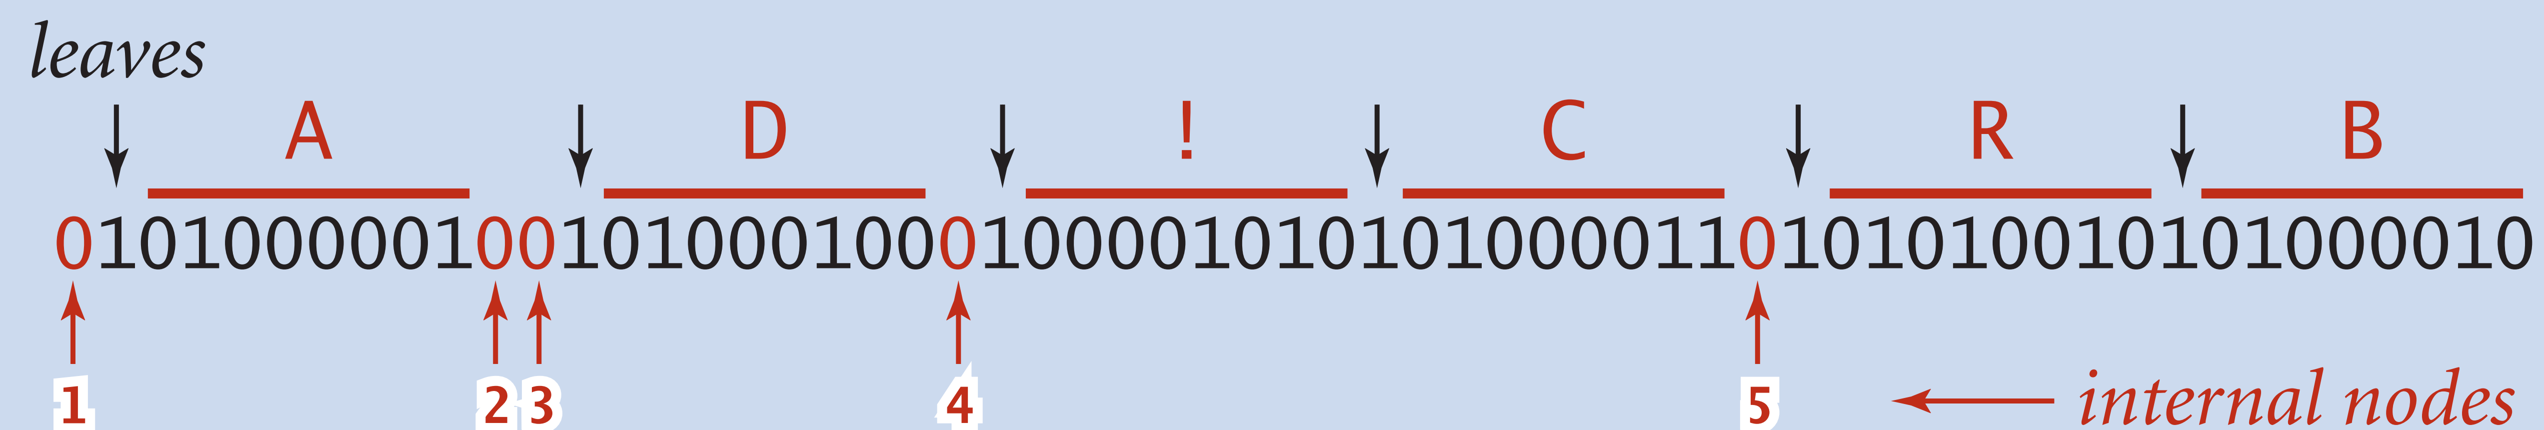


Q. How to transmit the binary trie?

A. Write preorder traversal; mark leaf nodes and internal nodes with a bit.

0 for internal nodes
1 for leaf nodes





https://algs4.cs.princeton.edu

5.5 Data Compression

- *introduction*
- *run-length encoding*
- *Huffman compression*
- *LZW compression*

Statistical methods

Static model. Same model for all messages.

- Fast but not optimal: different messages have different statistical properties.
- Ex: ASCII, Morse code.

Dynamic model. Generate model based on message.

- Preliminary pass needed to generate model; must transmit the model.
- Ex: Huffman code.

Adaptive model. Progressively learn and update model as you read message.

- More refined modeling can produces better compression.
- Ex: LZW.

LZW compression demo (for 7-bit chars and 8-bit codewords)

input	A	B	R	A	C	A	D	A	B	R	A	B	R	A	B	R	A

codeword table

Input.

- 7-bit ASCII chars.
- ASCII 'A' is 41_{16}.

Codeword table.

- 8-bit codewords.
- Codewords for single chars are ASCII values.
- Use codewords 81_{16} to FF_{16} for multiple chars.
- Stop symbol = 80_{16}.

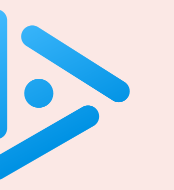
Data compression: quiz 4



Which is the LZW compression for ABABABA ?

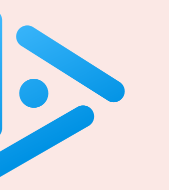
A. 41 42 41 42 41 42 80

B. 41 42 41 81 81 80

C. 41 42 81 81 41 80

D. 41 42 81 83 80

Data compression: quiz 5



Which is the key data structure to implement LZW compression efficiently?

A. Array.

B. Red–black BST.

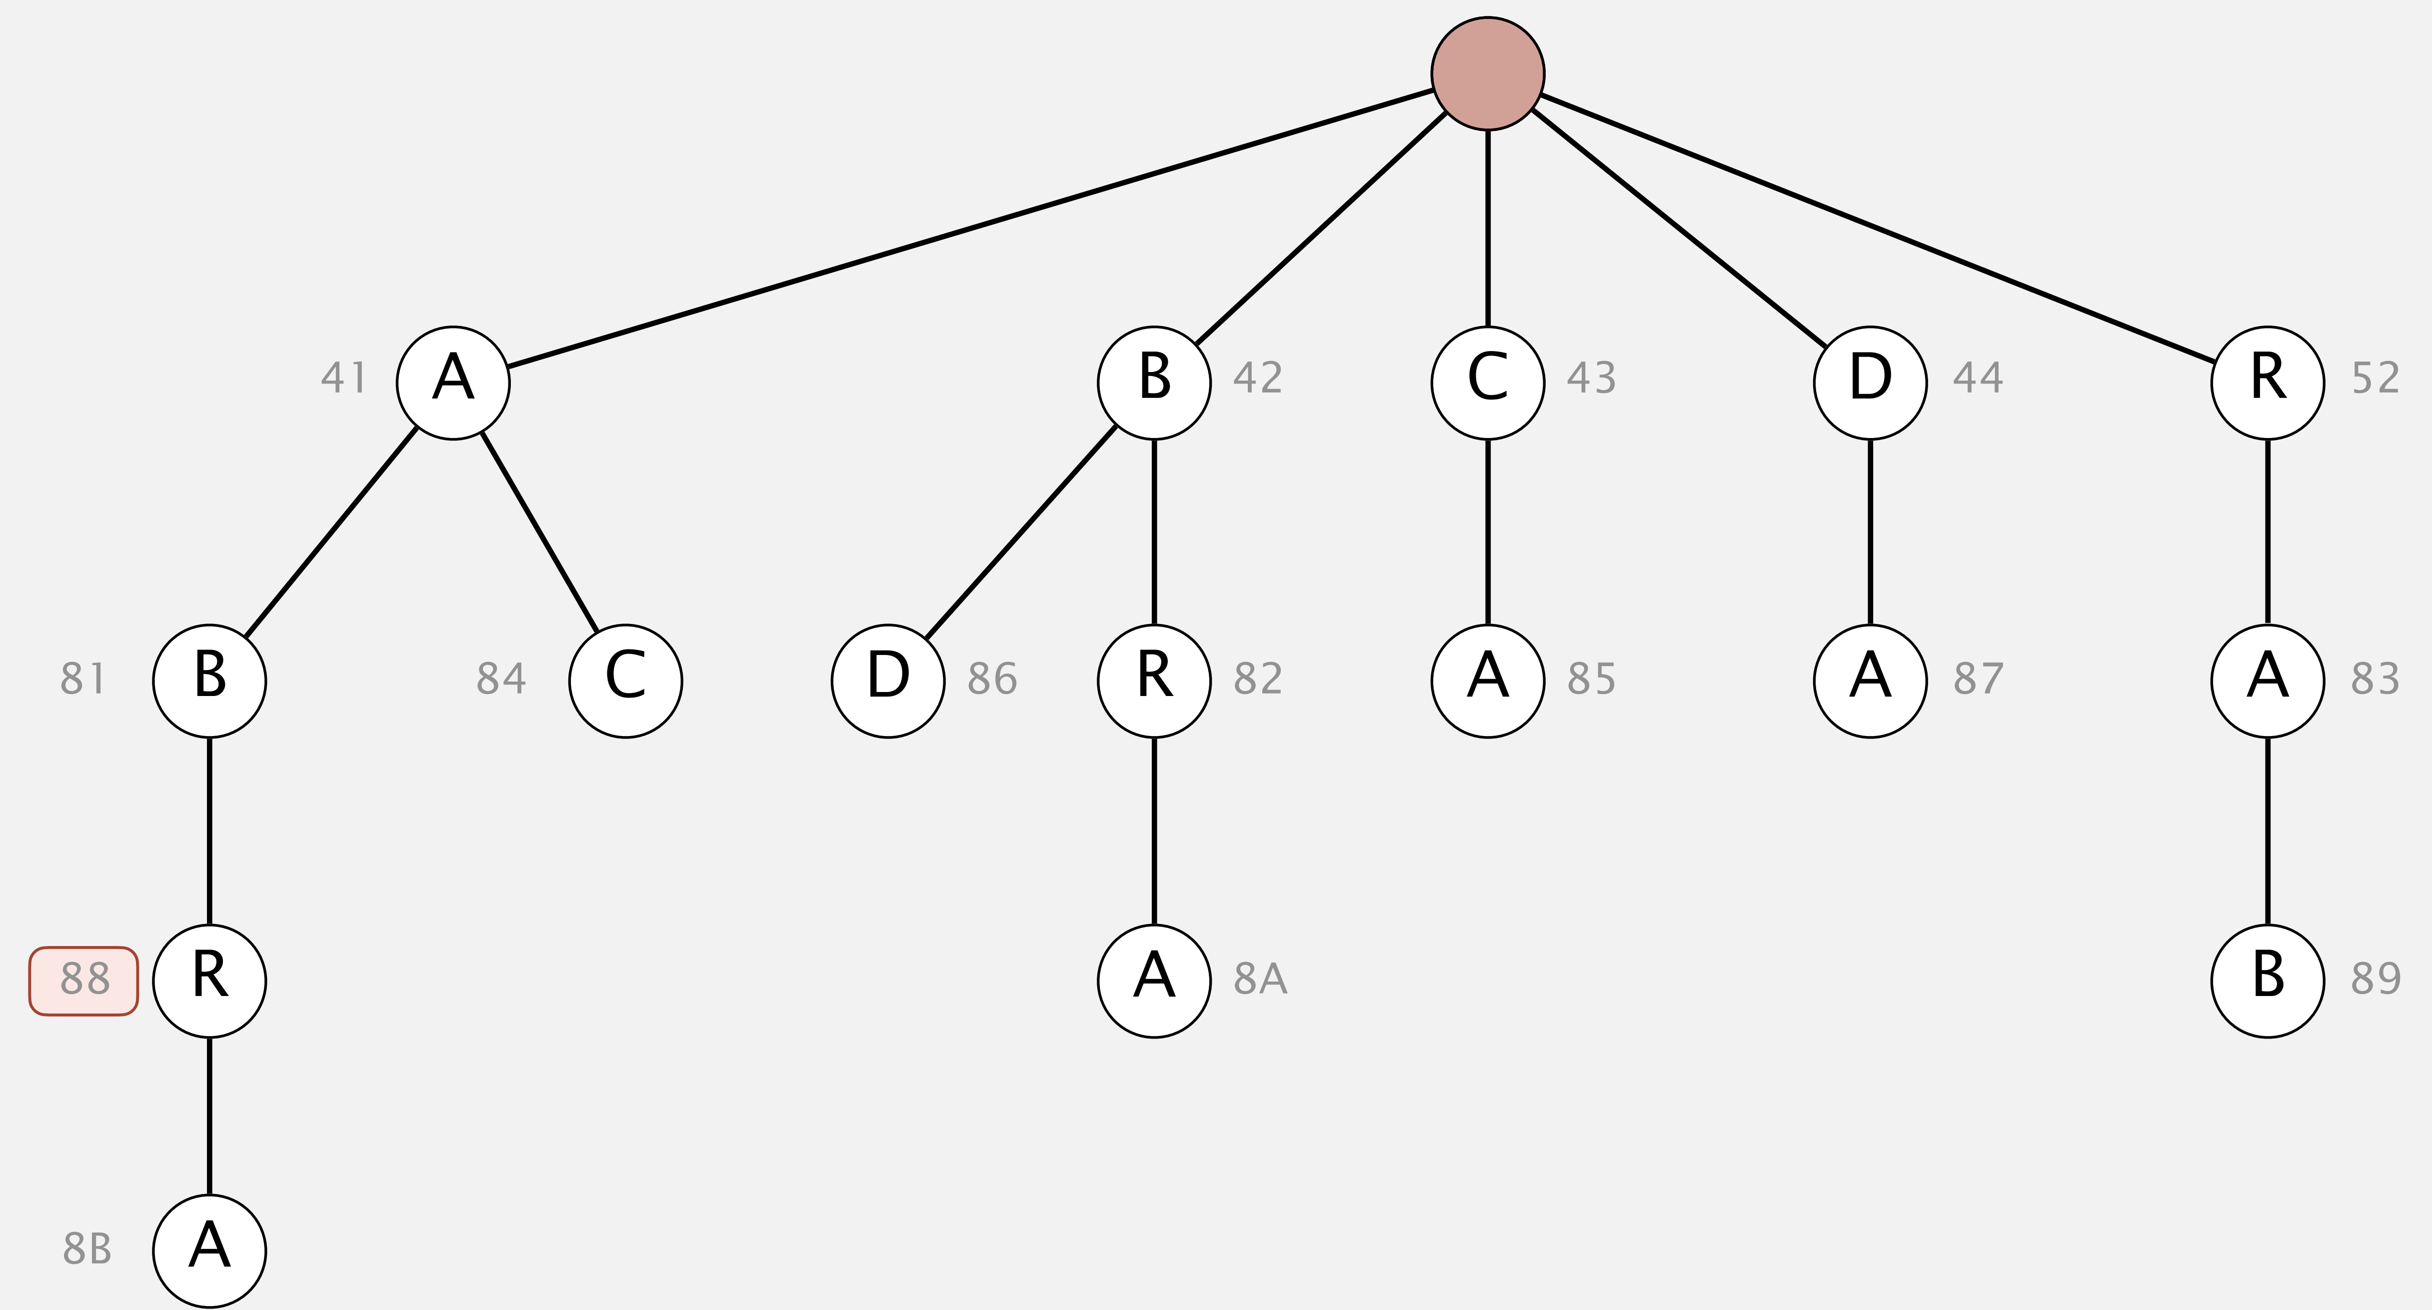
C. Hash table.

D. Trie.

Implementing LZW compression: longest prefix match

Find longest key in symbol table that is a prefix of query string.

input	...	R	A	B	R	A	B	R	A	B	R	O	C	C	O	L	I	...
value		89			82		88				88							



LZW in the real world

Lempel–Ziv and friends.

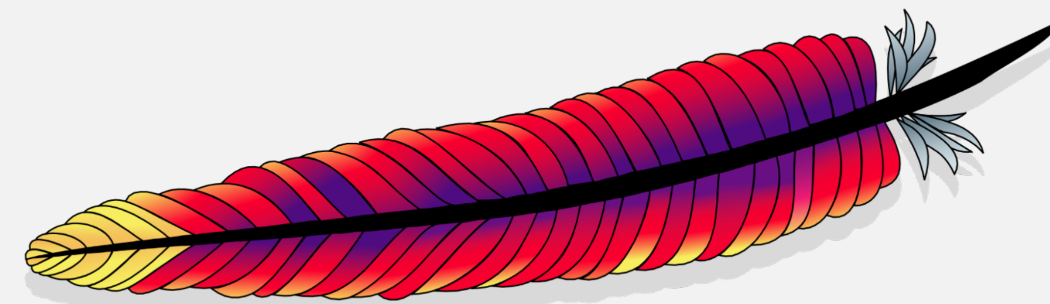
- LZ77.
- LZ78.
- LZW.
- Deflate / zlib = LZ77 variant + Huffman.

Unix compress, GIF, TIFF, V.42bis modem: LZW. ← previously under patent

zip, 7zip, gzip, jar, png, pdf: deflate / zlib.

iPhone, Wii, Apache HTTP server: deflate / zlib.

← not patented (widely used in open source)



Lossless data compression benchmarks

year	scheme	bits / char
1967	**ASCII**	7
1950	**Huffman**	4.7
1977	**LZ77**	3.94
1984	**LZMW**	3.32
1987	**LZH**	3.3
1987	**move-to-front**	3.24
1987	**LZB**	3.18
1987	**gzip**	2.71
1988	**PPMC**	2.48
1994	**SAKDC**	2.47
1994	**PPM**	2.34

1997	**BOA**	1.99
1999	**RK**	1.89

data compression using Calgary corpus

← next programming assignment

Data compression summary

Lossless compression.

- Represent fixed-length symbols with variable-length codes. [Huffman]
- Represent variable-length symbols with fixed-length codes. [LZW]

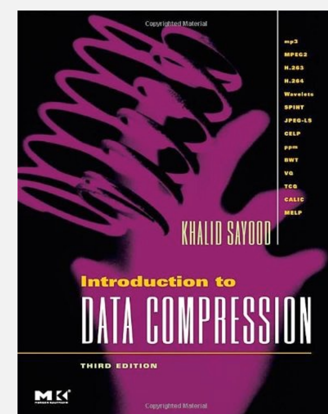
Lossy compression. [not covered in this course]

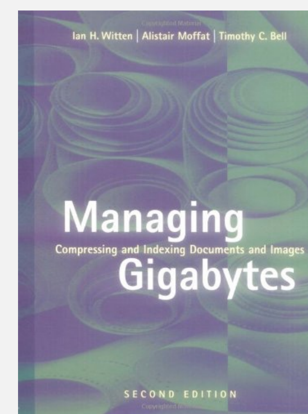
- JPEG, MPEG, MP3, ...
- FFT/DCT, wavelets, fractals, ...

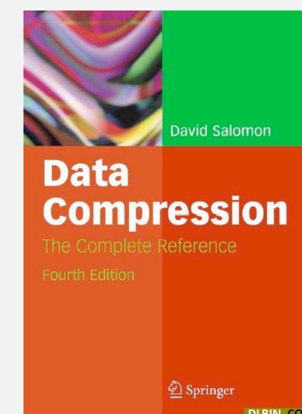
$$X_k = \sum_{i=0}^{n-1} x_i \cos\left[\frac{\pi}{n}\left(i+\frac{1}{2}\right)k\right]$$

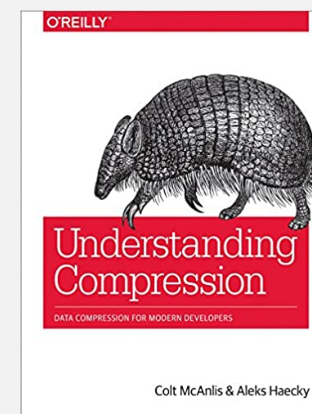
Theoretical limits on compression. Shannon entropy: $H(X) = -\sum_{i}^{n} p(x_i)\log_2 p(x_i)$

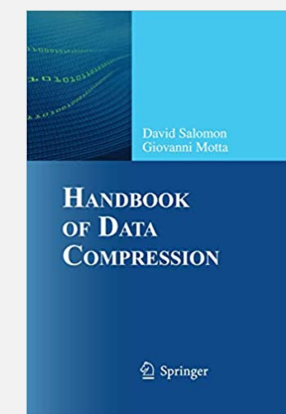
Practical compression. Exploit extra knowledge whenever possible.











© Copyright 2021 Robert Sedgewick and Kevin Wayne
