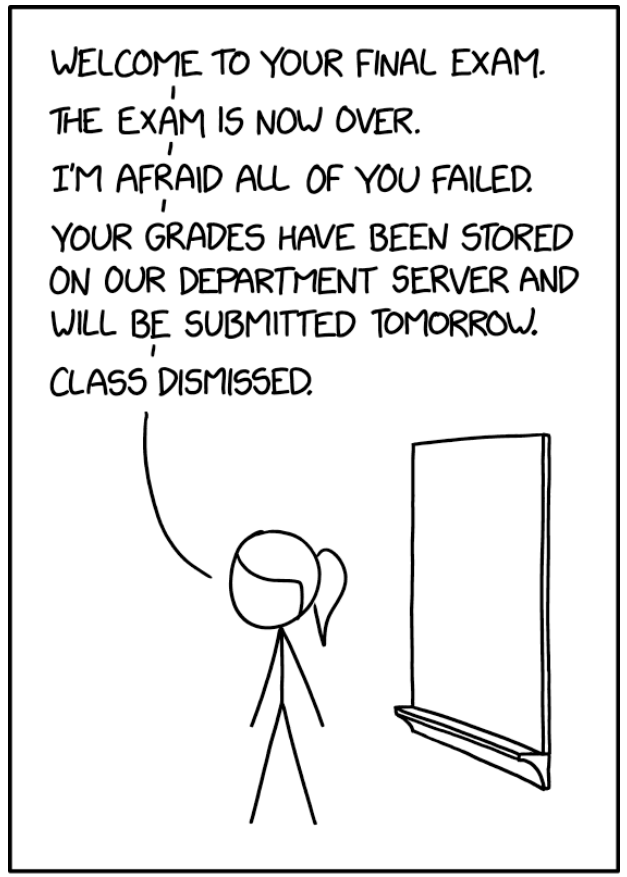
COS 217: Introduction to Programming Systems

Buffer Overrun Vulnerabilities and Assignment 6 (The 'B' Attack)



CYBERSECURITY FINAL EXAMS

xkcd.com/2385

PRINCETON UNIVERSITY

Yet another character reading loop program …

```
#include <stdio.h>
int main(void)
{
   char name[12], c;
   int i = 0, magic = 42;
   printf("What is your name?\n");
   while ((c = getchar()) != '\n')
      name[i++] = c;
   name[i] = '\0';
   printf("Thank you, %s.\n", name);
   printf("The answer to life, the universe, "
          "and everything is %d\n", magic);
   return 0;
}
```

```
$ ./a.out
  What is your name?
  John Smith
  Thank you, John Smith.
  The answer to life, the universe, and everything is 42
```

Why People With Long Names Have Issues with Computer Sy

```
#include <stdio.h>
int main(void)
{
   char name[12], c;
   int i = 0, magic = 42;
   printf("What is your name?\n");
   while ((c = getchar()) != '\n')
      name[i++] = c;
   name[i] = '\0';
   printf("Thank you, %s.\n", name);
   printf("The answer to life, the universe, "
          "and everything is %d\n", magic);
   return 0;
}
```

```
$ ./a.out
What is your name?
Szymon Rusinkiewicz
Thank you, Szymon Rusinkie
icz.
The answer to life, the universe, and everything is 8020841
```

?

???!!?!

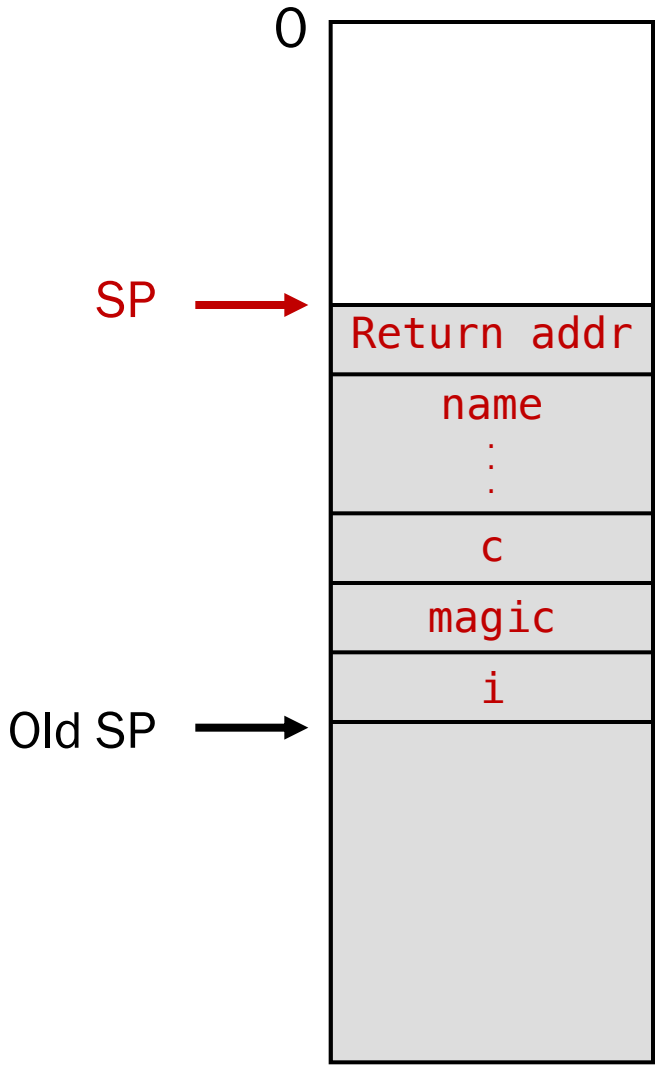
(Note: this is just the number that's actually printed when you actually run the code. It's not an attempt to Easter egg a phone number or anything like that. Please don't try to call it. kthx)

Explanation: Stack Frame Layout

When there are too many characters, program carelessly writes beyond space "belonging" to name.

- Overwrites other variables
- This is a *buffer overrun*, or *stack smash*
- The program has a security bug!

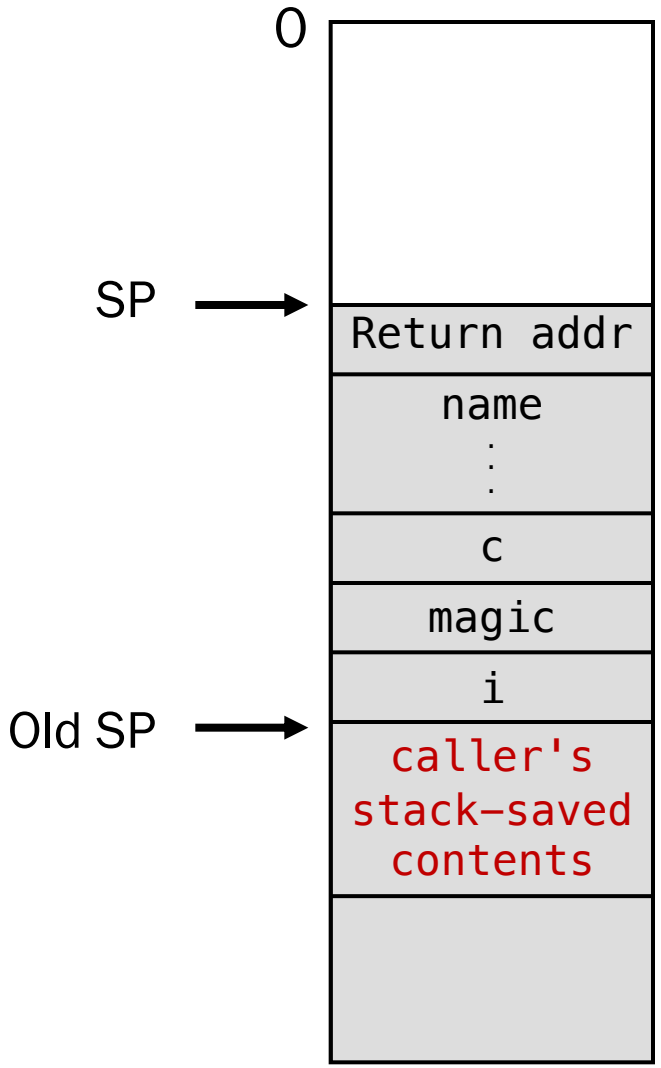
```
#include <stdio.h>
int main(void)
{
   char name[12], c;
   int i = 0, magic = 42;
   printf("What is your name?\n");
   while ((c = getchar()) != '\n')
      name[i++] = c;
   name[i] = '\0';
   printf("Thank you, %s.\n", name);
   printf("The answer to life, the universe, "
          "and everything is %d\n", magic);
   return 0;
}
```



It Gets Worse...

Buffer overrun can overwrite onto its caller function's stack frame!

```
#include <stdio.h>
int callee(void)
{
   char name[12], c;
   int i = 0, magic = 42;
   printf("What is your name?\n");
   while ((c = getchar()) != '\n')
      name[i++] = c;
   name[i] = '\0';
   printf("Thank you, %s.\n", name);
   printf("The answer to life, the universe, "
          "and everything is %d\n", magic);
   return 0;
}
```



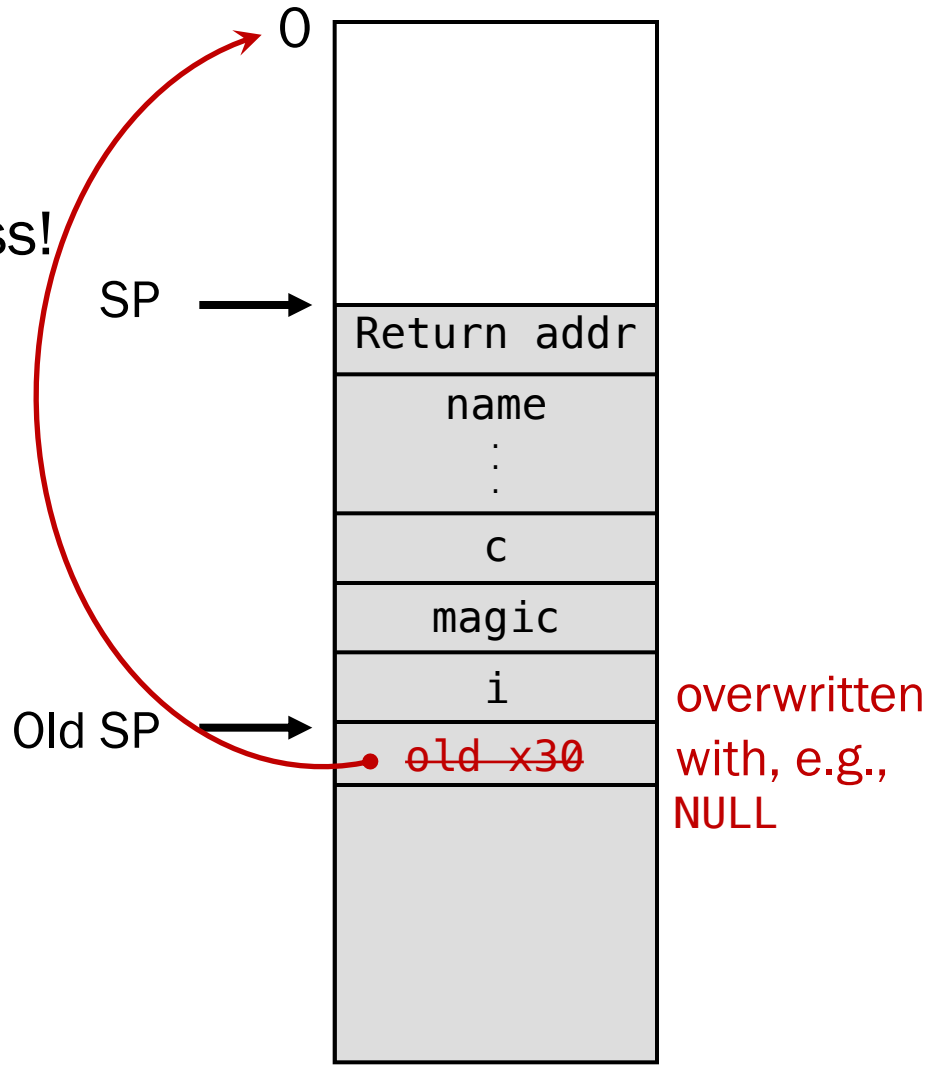
It Gets Worse...

And somewhere on caller's stack frame is the saved return address for that function ...

Buffer overrun can overwrite caller's return address!

- Replacement value can be an invalid address, leading to a segfault, or ...

```
#include <stdio.h>
int callee(void)
{
   char name[12], c;
   int i = 0, magic = 42;
   printf("What is your name?\n");
   while ((c = getchar()) != '\n')
      name[i++] = c;
   name[i] = '\0';
   printf("Thank you, %s.\n", name);
   printf("The answer to life, the universe, "
          "and everything is %d\n", magic);
   return 0;
}
```



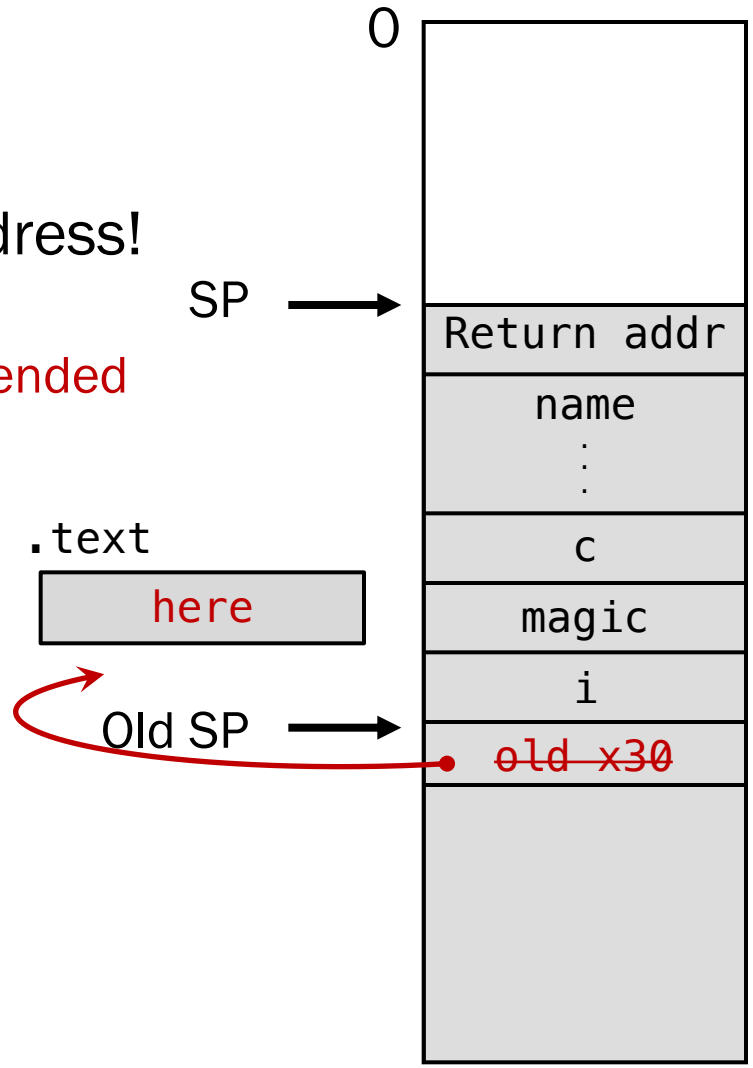
It Gets Much Worse...

And somewhere on caller's stack frame is the saved return address for that function ...

Buffer overrun can overwrite caller's return address!

- Replacement value can be an invalid address, leading to a segfault, or it can cleverly cause unintended control flow!

```
#include <stdio.h>
int callee(void)
{
   char name[12], c;
   int i = 0, magic = 42;
   printf("What is your name?\n");
   while ((c = getchar()) != '\n')
      name[i++] = c;
   name[i] = '\0';
   printf("Thank you, %s.\n", name);
   printf("The answer to life, the universe, "
          "and everything is %d\n", magic);
   return 0;
}
```



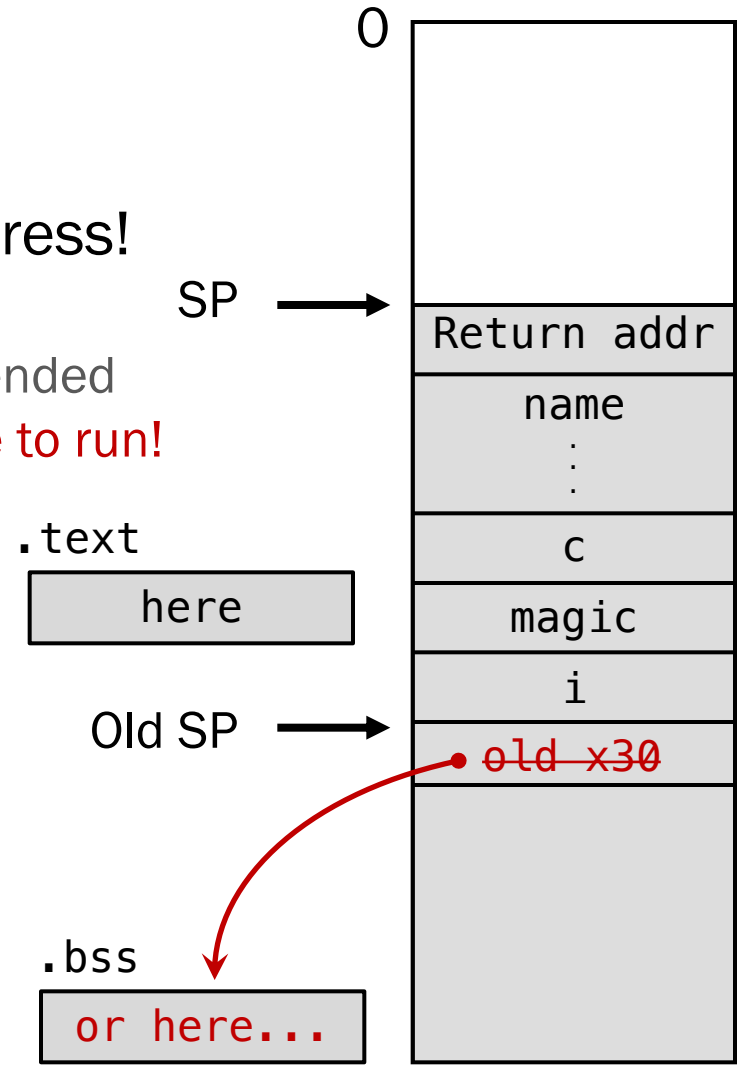
It Gets Much, Much Worse...

And somewhere on caller's stack frame is the saved return address for that function ...

Buffer overrun can overwrite caller's return address!

- Replacement value can be an invalid address, leading to a segfault, or it can cleverly cause unintended control flow, or even cause arbitrary malicious code to run!

```
#include <stdio.h>
int callee(void)
{
   char name[12], c;
   int i = 0, magic = 42;
   printf("What is your name?\n");
   while ((c = getchar()) != '\n')
      name[i++] = c;
   name[i] = '\0';
   printf("Thank you, %s.\n", name);
   printf("The answer to life, the universe, "
          "and everything is %d\n", magic);
   return 0;
}
```



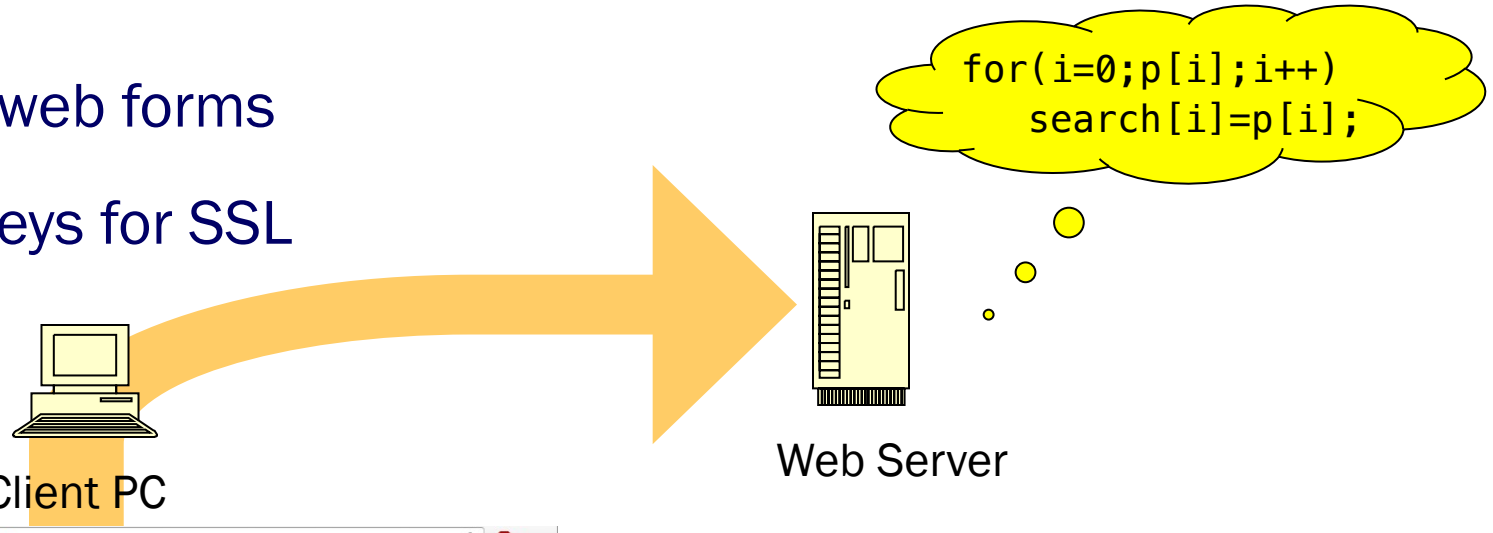
Attacking a Web Server

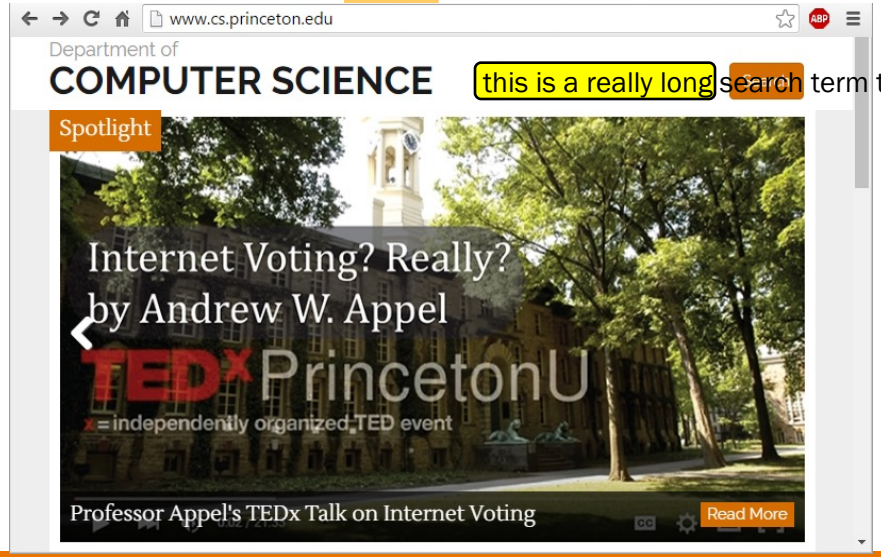
URLs

Input in web forms

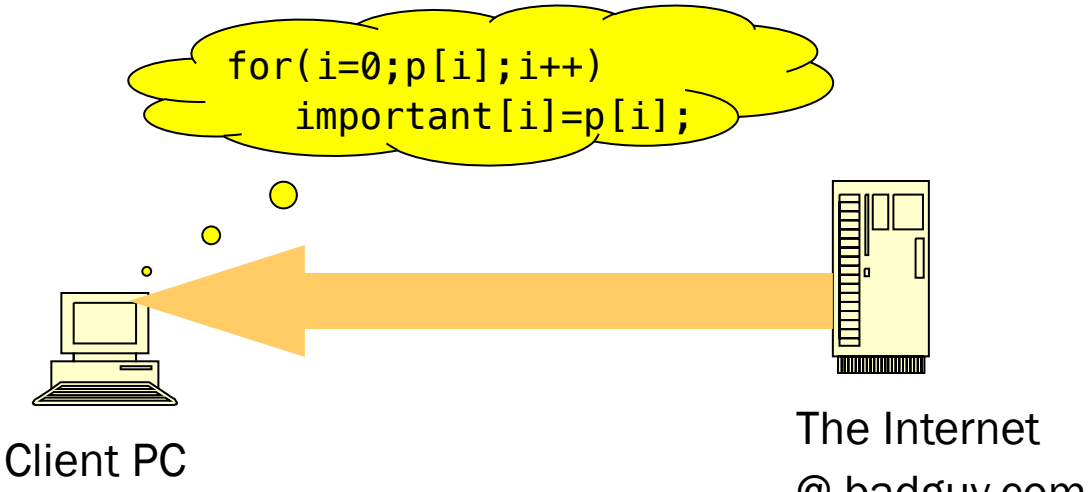
Crypto keys for SSL

etc.





Attacking Everything in Sight



webp image library (9/2023)

C/C++ MP4 video library (4/2023)

OpenSSL crypto library (11/2022)

Smart UPS devices (3/2022)

Zoom (11/2021)

VLC media player (1/2019)

Nintendo Switch (4/2018)

…

E-mail clients

PDF viewers

Operating-system kernels

TCP/IP Stack

Any application that ever sees input directly from the outside!

Defenses Against This Attack

Best: program in languages that make
array-out-of-bounds impossible (Java, python, C#, ML, …)

But if you need to use C…

Defenses Against This Attack

In C: use discipline and software analysis tools to check bounds of array subscripts

```
DESCRIPTION
       The  strcpy()  function  copies the string pointed to by src, including
       the terminating null byte ('\0'), to the buffer  pointed  to  by  dest.
       The  strings  may  not overlap, and the destination string dest must be
       large enough to receive the copy.  Beware  of  buffer  overruns!  (See
       BUGS.)

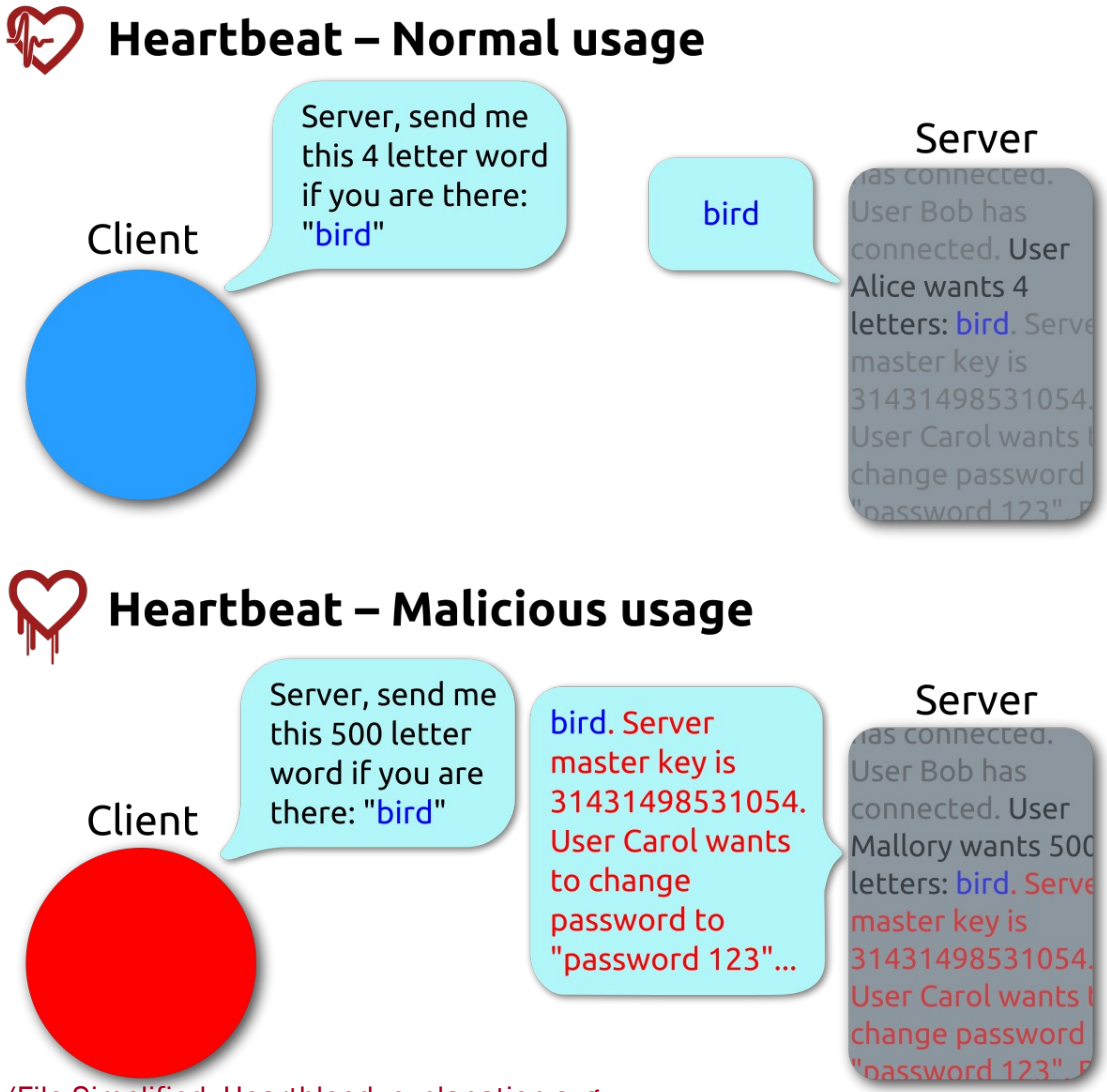
BUGS
       Never use gets().  Because it is impossible to tell without knowing the data in advance how many characters gets() will  read,  and
       because gets() will continue to store characters past the end of the buffer, it is extremely dangerous to use.  It has been used to
       break computer security.  Use fgets() instead.
```

Augmented by OS- or compiler-level mitigations:

- Randomize initial stack pointer
- “No-execute” memory permission for sections other than .text
- “Canaries” at end of stack frames

None of these would have prevented the “Heartbleed” attack

Half a billion dollars worth of heartburn ...



https://en.wikipedia.org/wiki/Heartbleed#/media/File:Simplified_Heartbleed_explanation.svg

Assignment 6: Attack the “Grader” Program

```
enum {BUFSIZE = 48};
char grade = 'D';
char name[BUFSIZE];
...
int main(void)
{
   mprotect(...);
   getname();
   if (strcmp(name, "Andrew Appel") == 0)
      grade = 'B';
   printf("%c is your grade.\n", grade);
   printf("Thank you, %s.\n", name);
   return 0;
}
```

```
$ ./grader
What is your name?
Joe Student
D is your grade.
Thank you, Joe Student.
$ ./grader
What is your name?
Andrew Appel
B is your grade.
Thank you, Andrew Appel.
```

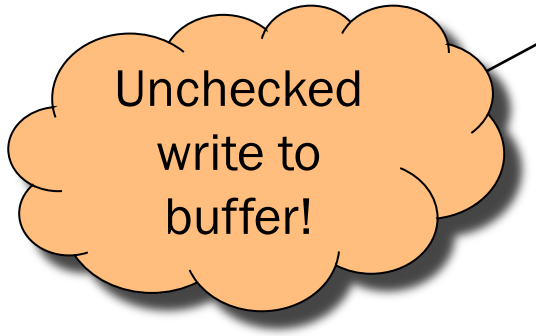
Assignment 6: Attack the “Grader” Program

```
/* Prompt for name and read it */
void getName() {
  printf("What is your name?\n");
  readString();
}
```

```
/* Read a string into name */
void readString() {
  char buf[BUFSIZE];
  int i = 0;
  int c;

  /* Read string into buf[] */
  for (;;) {
    c = fgetc(stdin);
    if (c == EOF || c == '\n')
      break;
    buf[i] = c;
    i++;
  }
  buf[i] = '\0';

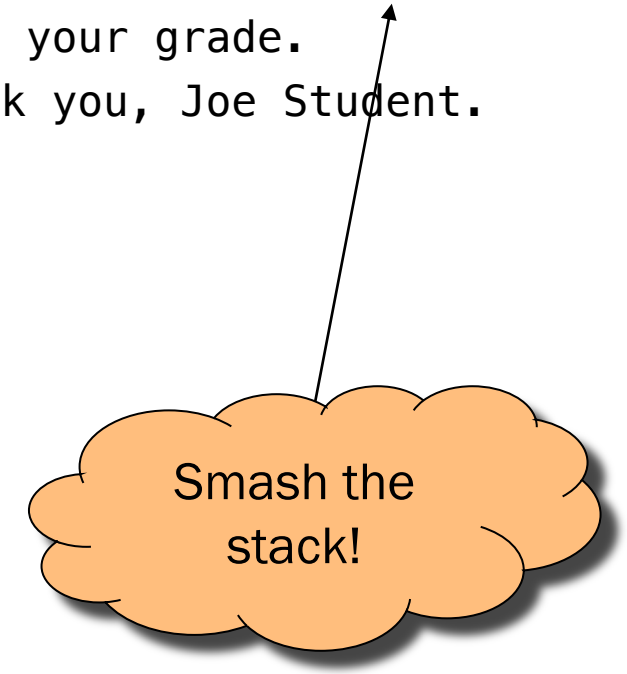
  /* Copy buf[] to name[] */
  for (i = 0; i < BUFSIZE; i++)
    name[i] = buf[i];
}
```



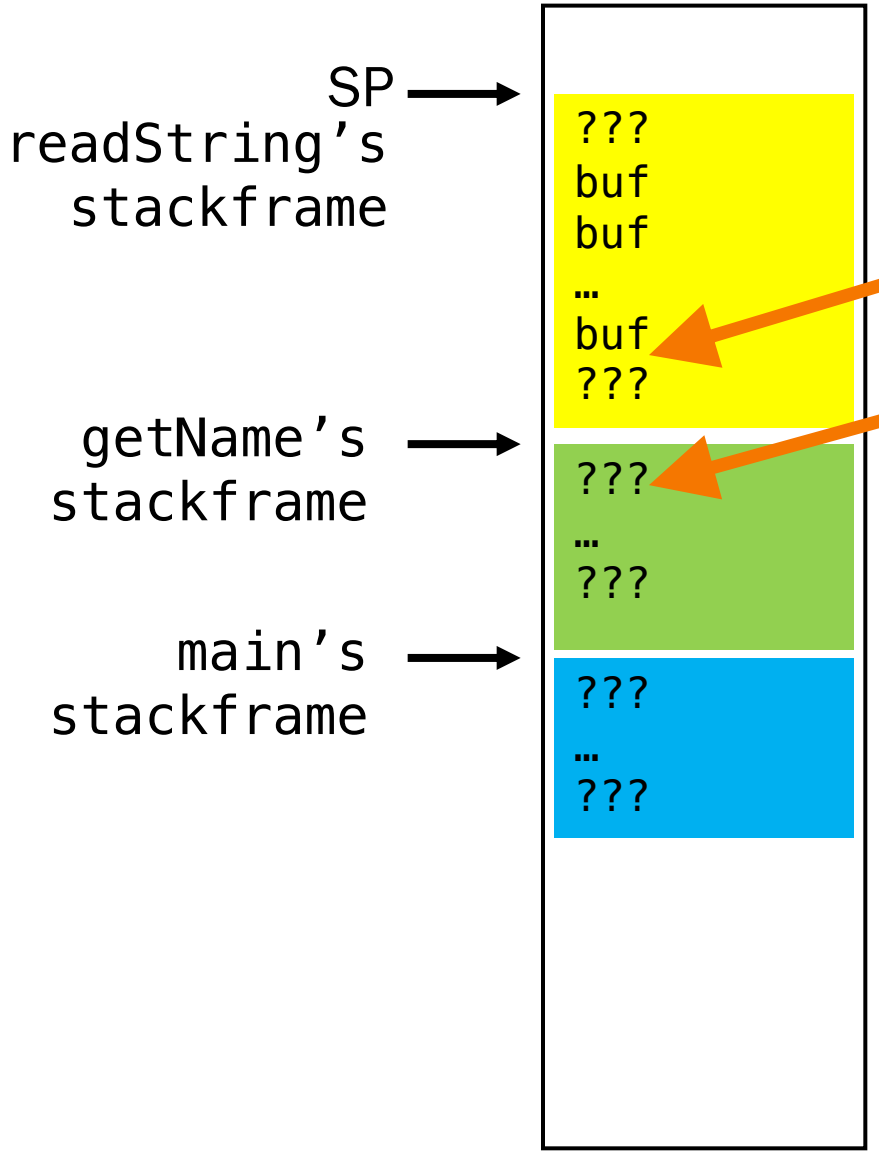
Assignment 6: Attack the “Grader” Program

```
enum {BUFSIZE = 48};
char grade = 'D';
char name[BUFSIZE];
...
int main(void)
{
   mprotect(...);
   getname();
   if (strcmp(name, "Andrew Appel") == 0)
      grade = 'B';
   printf("%c is your grade.\n", grade);
   printf("Thank you, %s.\n", name);
   return 0;
}
```

```
$ ./grader
What is your name?
Joe Student\0(#@&$%*#&(*^!@%*!(&$
B is your grade.
Thank you, Joe Student.
```



Memory Map of STACK Section



Keep writing past end of buf

Get to getName's stackframe

What's there?

getName's saved x30! (somewhere on stack)

Overwrite it!

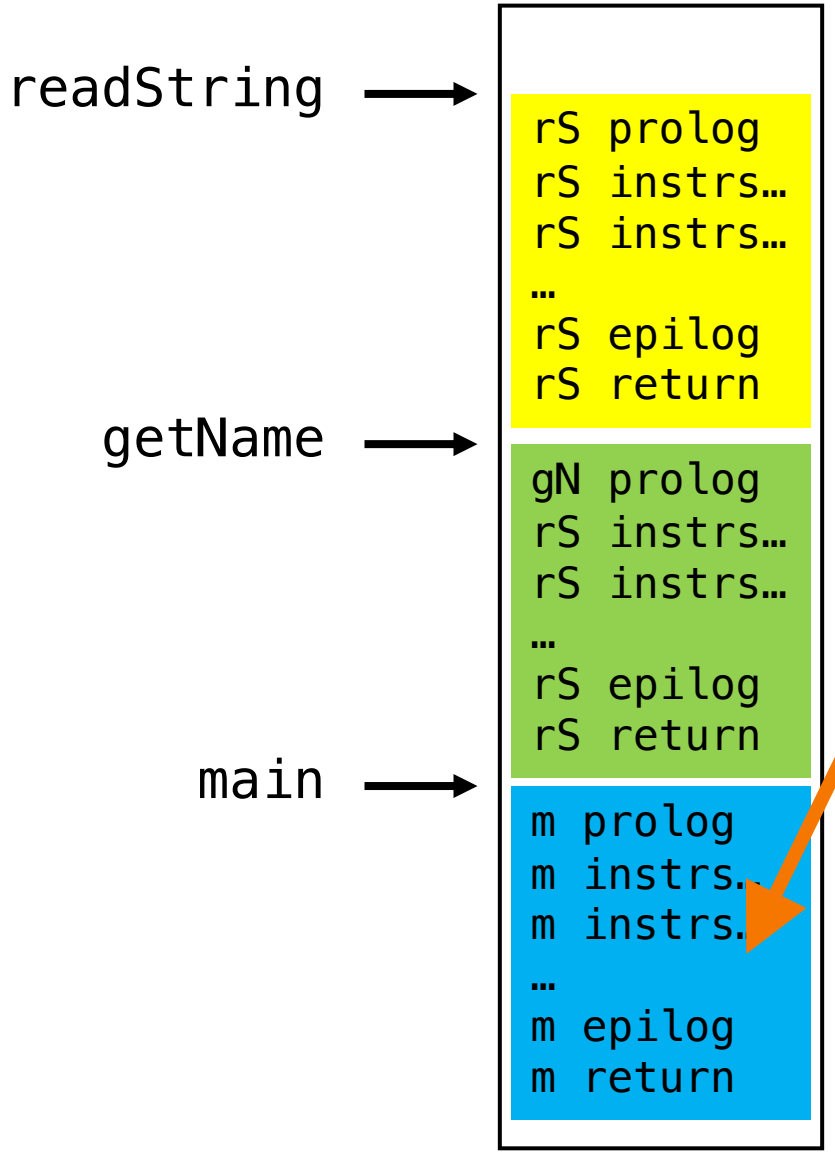
With what?

Assignment 6: Attack the “Grader” Program

```
enum {BUFSIZE = 48};
char grade = 'D';
char name[BUFSIZE];
...
int main(void)
{
   mprotect(...);
   getname();
   if (strcmp(name, "Andrew Appel") == 0)
      grade = 'B';
   printf("%c is your grade.\n", grade);
   printf("Thank you, %s.\n", name);
   return 0;
}
```

```
$ ./grader
What is your name?
Joe Student\0(#@&$%*#&(*^!@%*!(&$
B is your grade.
Thank you, Joe Student.
```

Memory Map of TEXT Section



(All of these instructions are actually machine code, not flattened C, of course!)

```
...
checkappel:
    if (strcmp(name, "Andrew Appel") != 0)
        goto afterb
    grade = 'B' ← HERE!
afterb:
    print ...
...
```

Construct Your Exploit String (`createdataB.c`)

1. Your name.
   - After all, the `grader` program's last line of output must be:
     "`Thank you, [your name].`"

2. A null byte.
   - Otherwise, the `grader` program's last line of output will be corrupted.

3. Filler to overrun until `x30`.
   - Presumably more null bytes are easiest, but easter eggs are fine.

4. The address of the target
   - The statement `grade = 'B'`.

`fopen` the file `"dataB"` and write your name into that file (e.g. with `fprintf`)

See "Writing Binary Data" precept handout. `'\0'` is just a single byte of binary data.

Address is a 64-bit (little-endian) unsigned integer: C `unsigned long`

Let's Not Get Thrown in Jail, Please

Summary

- This lecture:
  - Buffer overrun attacks in general
  - Assignment 6 “B Attack” principles of operation
- Next precept:
  - Assignment 6 “B Attack” recap
  - Memory map using gdb
  - Writing binary data
- Final 2 lectures:
  - Assignment 6 “A Attack” overview
  - Machine language details needed for “A Attack”
  - *Finally* finishing the 4-stage build process: the Linker!
- Final precept:
  - MiniAssembler and ”A Attack” details

Final Exam Info

What: Final Exam!

When: ~3 weeks from today
Thursday, Dec 21
7:30pm – 10:30 pm

Where: McDonnell A01/A02

How: On paper. Closed book, but 1 two-sided study sheet allowed.

Why: Cumulative assessment. You've learned a lot, so show us!

Info: https://www.cs.princeton.edu/courses/archive/fall23/cos217/exam2.php
