

COS 217: Introduction to Programming Systems

Buffer Overrun Vulnerabilities and Assignment 6 (The 'B' Attack)

CYBERSECURITY FINAL EXAMS

xkcd.com/2385

PRINCETON UNIVERSITY

Yet another character reading loop program ...

```
#include <stdio.h>
int main(void)
{
    char name[12], c;
    int i = 0, magic = 42;
    printf("What is your name?\n");
    while ((c = getchar()) != '\n')
        name[i++] = c;
    name[i] = '\0';
    printf("Thank you, %s.\n", name);
    printf("The answer to life, the universe, "
          "and everything is %d\n", magic);
    return 0;
}
```

\$./a.out

What is your name?

John Smith

Thank you, John Smith.

The answer to life, the universe, and everything is 42

@grakozy

Explanation: Stack Frame Layout

When there are too many characters, program carelessly writes beyond space “belonging” to name.

- Overwrites other variables
- This is a *buffer overrun*, or *stack smash*
- The program has a security bug!

```
#include <stdio.h>
int main(void)
{
    char name[12], c;
    int i = 0, magic = 42;
    printf("What is your name?\n");
    while ((c = getchar()) != '\n')
        name[i++] = c;
    name[i] = '\0';
    printf("Thank you, %s.\n", name);
    printf("The answer to life, the universe, "
        "and everything is %d\n", magic);
    return 0;
}
```

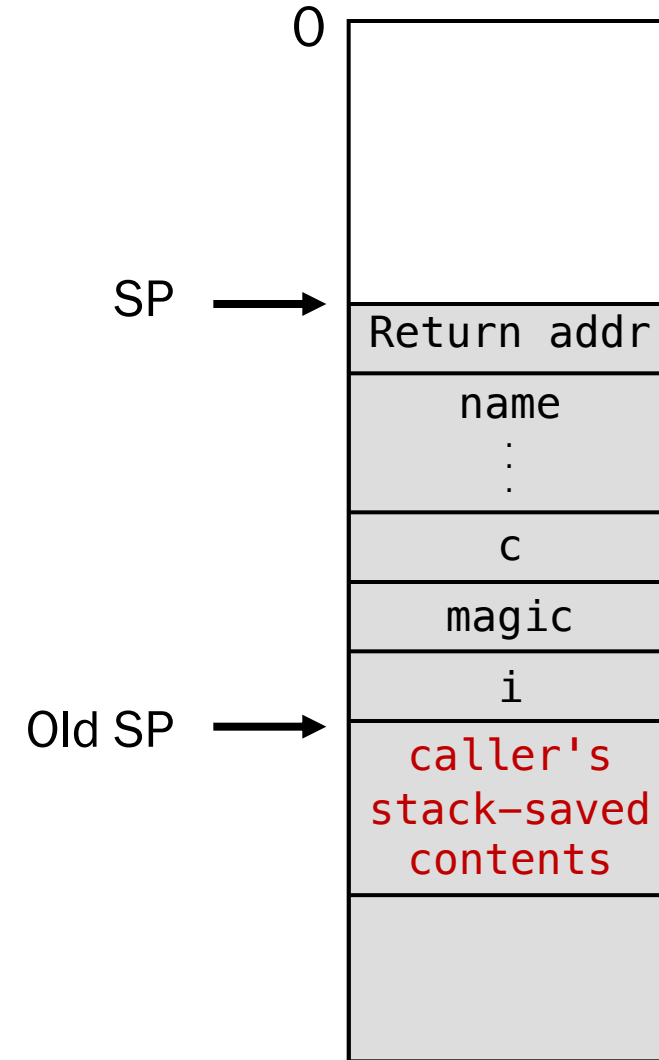

It Gets Worse...

Buffer overrun can overwrite onto its caller function's stack frame!

```
#include <stdio.h>
int callee(void)
{
    char name[12], c;
    int i = 0, magic = 42;
    printf("What is your name?\n");
    while ((c = getchar()) != '\n')
        name[i++] = c;
    name[i] = '\0';
    printf("Thank you, %s.\n", name);
    printf("The answer to life, the universe, "
           "and everything is %d\n", magic);
    return 0;
}
```

It Gets **Even** Worse...

And somewhere on caller's stack frame is the saved return address for that function ...

Buffer overrun can overwrite caller's return address!

- Replacement value can be an invalid address, leading to a segfault.

```
#include <stdio.h>
int callee(void)
{
    char name[12], c;
    int i = 0, magic = 42;
    printf("What is your name?\n");
    while ((c = getchar()) != '\n')
        name[i++] = c;
    name[i] = '\0';
    printf("Thank you, %s.\n", name);
    printf("The answer to life, the universe, "
           "and everything is %d\n", magic);
    return 0;
}
```

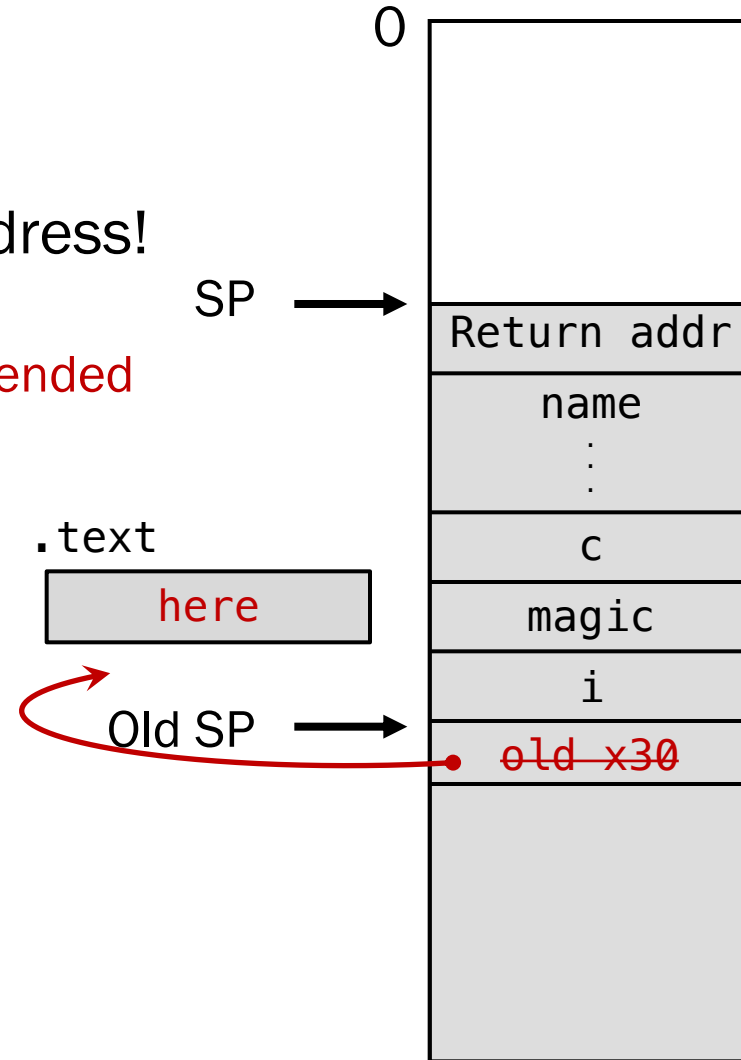

It Gets **Much** Worse...

And somewhere on caller's stack frame is the saved return address for that function ...

Buffer overrun can overwrite caller's return address!

- Replacement value can be an invalid address, leading to a segfault, **or it can cleverly cause unintended control flow!**

```
#include <stdio.h>
int callee(void)
{
    char name[12], c;
    int i = 0, magic = 42;
    printf("What is your name?\n");
    while ((c = getchar()) != '\n')
        name[i++] = c;
    name[i] = '\0';
    printf("Thank you, %s.\n", name);
    printf("The answer to life, the universe, "
           "and everything is %d\n", magic);
    return 0;
}
```

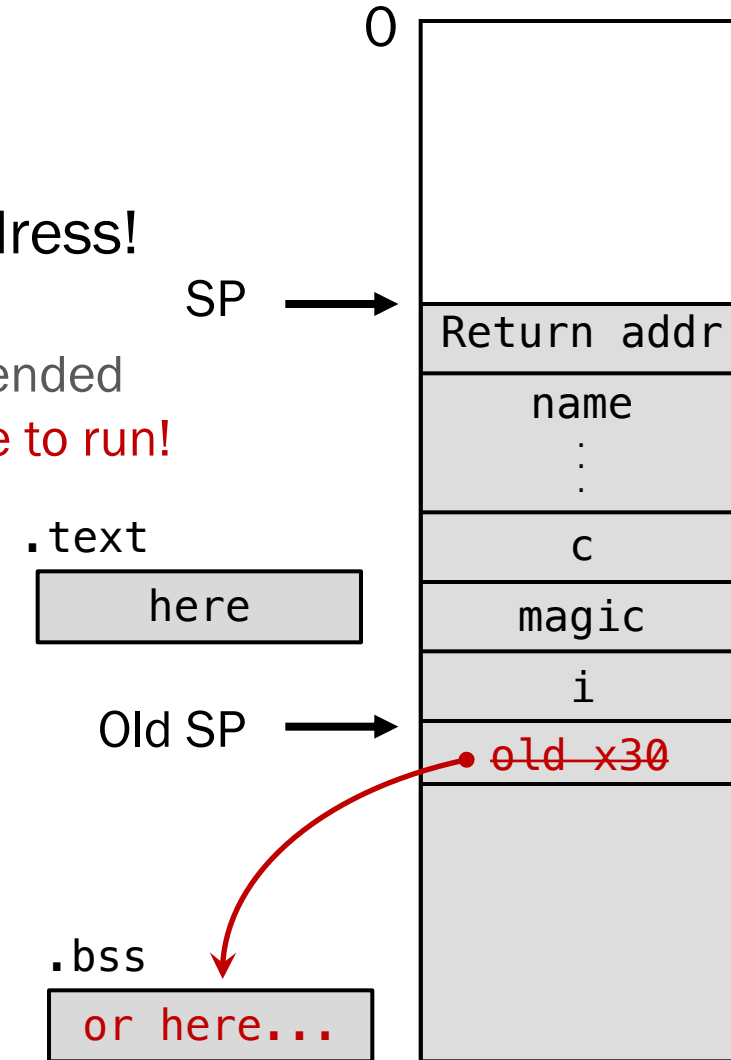

It Gets Much, Much Worse...

And somewhere on caller's stack frame is the saved return address for that function ...

Buffer overrun can overwrite caller's return address!

- Replacement value can be an invalid address, leading to a segfault, or it can cleverly cause unintended control flow, **or even cause arbitrary malicious code to run!**

```
#include <stdio.h>
int callee(void)
{
    char name[12], c;
    int i = 0, magic = 42;
    printf("What is your name?\n");
    while ((c = getchar()) != '\n')
        name[i++] = c;
    name[i] = '\0';
    printf("Thank you, %s.\n", name);
    printf("The answer to life, the universe, "
           "and everything is %d\n", magic);
    return 0;
}
```

Attacking a Web Server

URLs

Input in web forms

Crypto keys for SSL

etc.

this is a really long search term that overflows a buffer

Attacking Everything in Sight

Just in 2025 >100, including:

Adobe, Excel, FFmpeg,
GNU objdump, router software
Just in 11/25: Intel, GitHub,
Chrome, Dell ControlVault

Zoom (dozens, most recent 4/2025)

webp image library (9/2023)

C/C++ MP4 video library (4/2023)

OpenSSL crypto library (11/2022)

Smart UPS devices (3/2022)

VLC media player (1/2019)

Nintendo Switch (4/2018)

...

E-mail clients

PDF viewers

Operating-system kernels

TCP/IP Stack

Any application that ever sees input directly from the outside!

Defenses Against This Attack

Best: program in languages that make array-out-of-bounds impossible (Java, python, C#, ML, ...)

But if you need to use C...

Defenses Against This Attack

In C: use discipline and software analysis tools to check bounds of array subscripts

DESCRIPTION

The `strcpy()` function copies the string pointed to by `src`, including the terminating null byte (`'\0'`), to the buffer pointed to by `dest`. The strings may not overlap, and the destination string `dest` must be large enough to receive the copy. Beware of buffer overruns! (See BUGS.)

BUGS

Never use `gets()`. Because it is impossible to tell without knowing the data in advance how many characters `gets()` will read, and because `gets()` will continue to store characters past the end of the buffer, it is extremely dangerous to use. It has been used to break computer security. Use `fgets()` instead.

Augmented by OS- or compiler-level mitigations:

- Randomize initial stack pointer
- “No-execute” memory permission for sections other than `.text`
- “Canaries” at end of stack frames

None of these would have prevented the “Heartbleed” attack

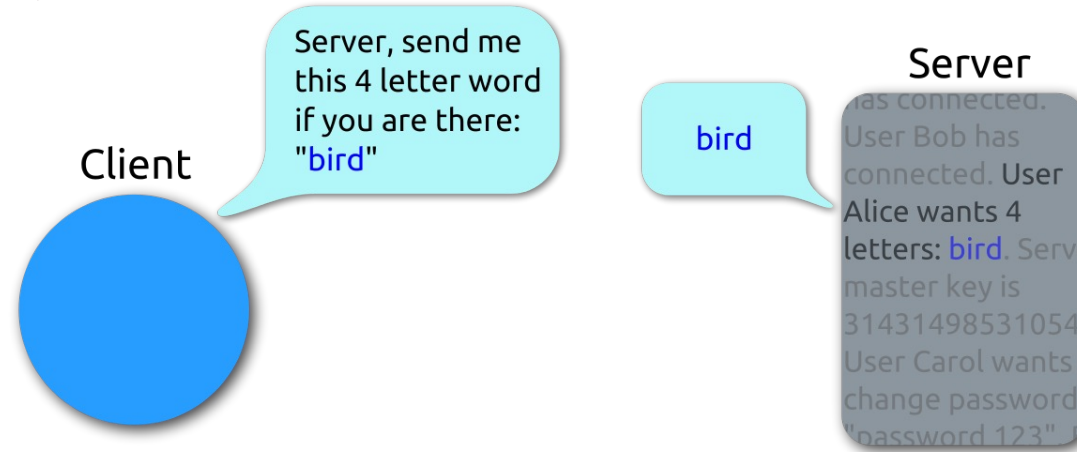

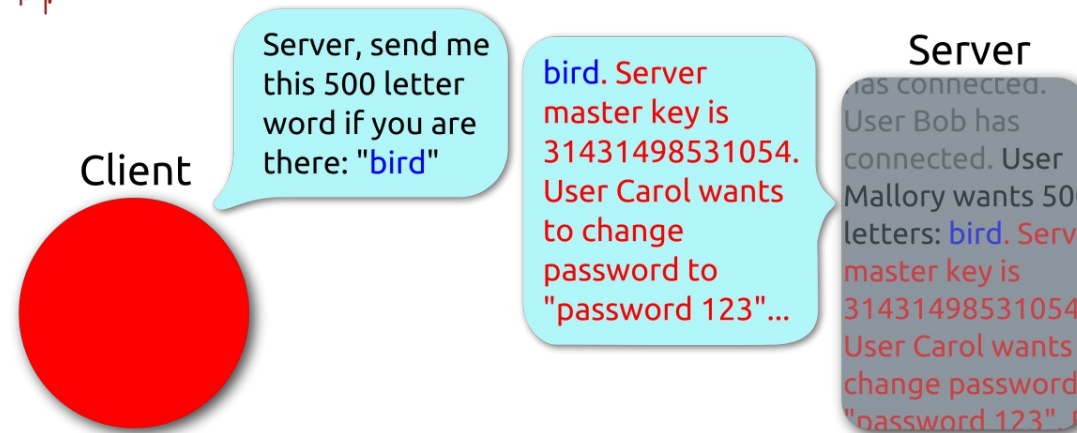

Half a billion dollars worth of heartburn ...

Heartbeat – Normal usage

Heartbeat – Malicious usage

Assignment 6: Attack the “Grader” Program

```
enum {BUFSIZE = 48};
char grade = 'D';
char name[BUFSIZE];
...
int main(void)
{
    mprotect(...);
    getname();
    if (strcmp(name, "Andrew Appel") == 0)
        grade = 'B';
    printf("%c is your grade.\n", grade);
    printf("Thank you, %s.\n", name);
    return 0;
}
```

```
$ ./grader
What is your name?
Joe Student
D is your grade.
Thank you, Joe Student.
$ ./grader
What is your name?
Andrew Appel
B is your grade.
Thank you, Andrew Appel.
```

Assignment 6: Attack the “Grader” Program

```
/* Prompt for name and read it */  
void getName() {  
    printf("What is your name?\n");  
    readString();  
}
```

```
/* Read a string into name */  
void readString() {  
    char buf[BUFSIZE];  
    int i = 0;  
    int c;  
  
    /* Read string into buf[] */  
    for (;;) {  
        c = fgetc(stdin);  
        if (c == EOF || c == '\n')  
            break;  
        buf[i] = c;  
        i++;  
    }  
    buf[i] = '\0';  
  
    /* Copy buf[] to name[] */  
    for (i = 0; i < BUFSIZE; i++)  
        name[i] = buf[i];  
}
```

Unchecked
write to
buffer!

Assignment 6: Attack the “Grader” Program

```
enum {BUFSIZE = 48};
char grade = 'D';
char name[BUFSIZE];
...
int main(void)
{
    mprotect(...);
    getname();
    if (strcmp(name, "Andrew Appel") == 0)
        grade = 'B';
    printf("%c is your grade.\n", grade);
    printf("Thank you, %s.\n", name);
    return 0;
}
```

\$./grader

What is your name?

Joe Student\0(#@&\$%*#&(*^!@%*!(&\$

B is your grade.

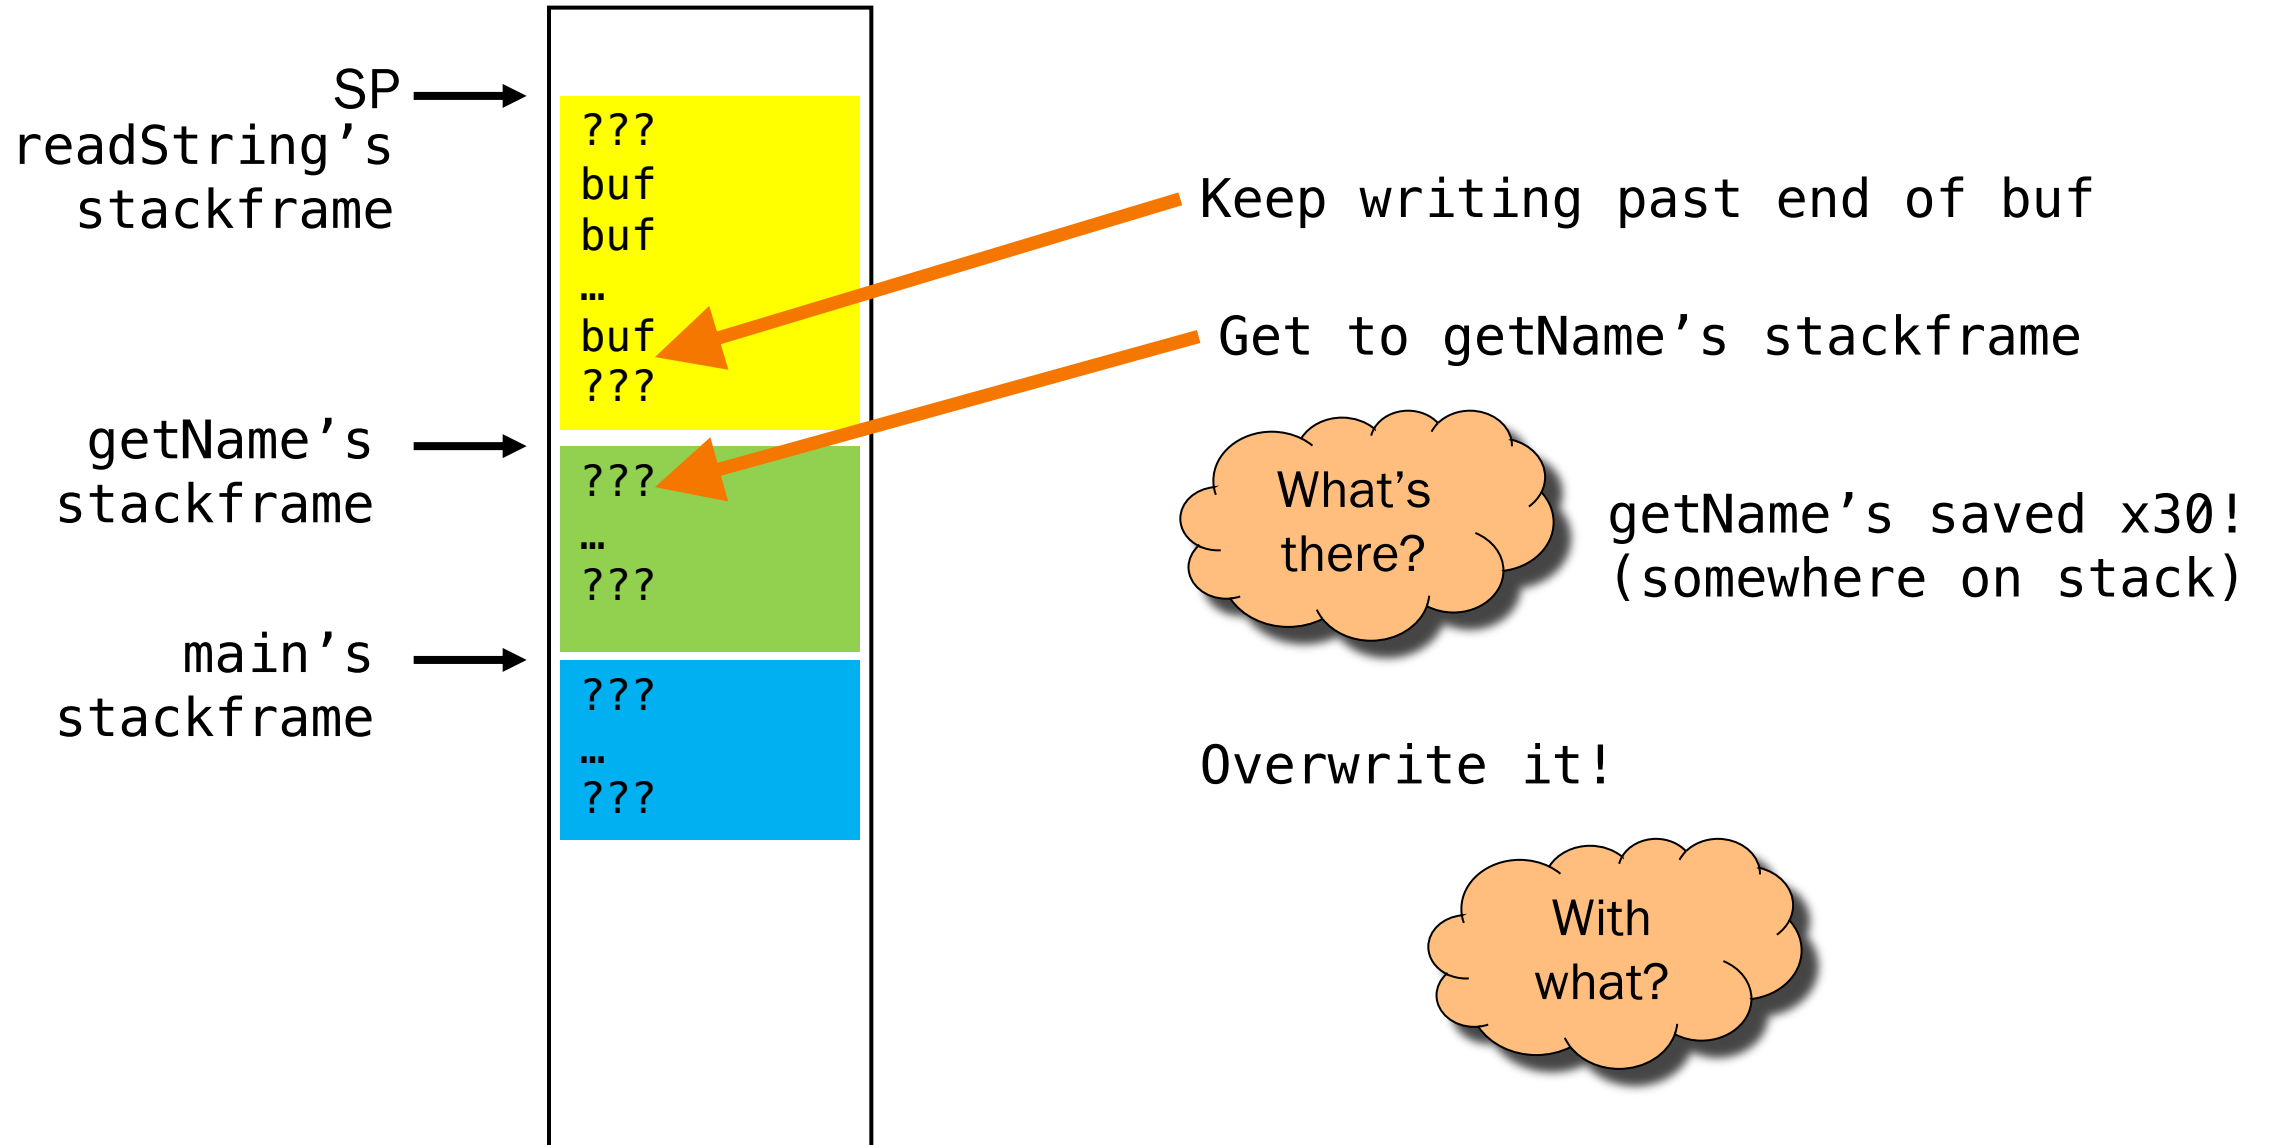

Thank you, Joe Student.

Smash the stack!

Memory Map of STACK Section

Assignment 6: Attack the “Grader” Program

```
enum {BUFSIZE = 48};
char grade = 'D';
char name[BUFSIZE];
...
int main(void)
{
    mprotect(...);
    getname();
    if (strcmp(name, "Andrew Appel") == 0)
        grade = 'B';
    printf("%c is your grade.\n", grade);
    printf("Thank you, %s.\n", name);
    return 0;
}
```

\$./grader

What is your name?

Joe Student\0(#@&\$%*#&(*^!@%*!(&\$

B is your grade.

Thank you, Joe Student.

rS return
```

main →

```
m prolog
m instrs.
m instrs.
...
m epilog
m return
```

(All of these instructions are actually machine code, not flattened C, of course!)

```
...
checkappel:
    if (strcmp(name, "Andrew Appel") != 0)
        goto afterb
    grade = 'B' ← HERE!
afterb:
    print ...
...
```

Construct Your Exploit String (createdataB.c)

1. Your name.

- After all, the grader program's last line of output must be:
"Thank you, [your name]."

fopen the file "dataB" and write your name into that file (e.g. with fprintf)

2. A null byte.

- Otherwise, the grader program's last line of output will be corrupted.

See "Writing Binary Data" precept handout. '`\0`' is just a single byte of binary data.

3. Filler to overrun until x30.

- Presumably more null bytes are easiest, but easter eggs are fine.

4. The address of the target

- The statement `grade = 'B'`.

Address is a 64-bit (little-endian) unsigned integer: C unsigned long

Let's Not Get Thrown in Jail, Please

Summary

- This lecture:
 - Buffer overrun attacks in general
 - Assignment 6 “B Attack” principles of operation
- Next precept:
 - Assignment 6 “B Attack” recap
 - Memory map using gdb
 - Writing binary data
- Final 2 lectures:
 - Assignment 6 “A Attack” overview
 - Machine language details needed for “A Attack”
 - *Finally* finishing the 4-stage build process: the Linker!
- Final precept:
 - MiniAssembler and “A Attack” details

Final Exam Info

What: Final Exam!

When: 4 weeks from yesterday ⌚ 😱
Tuesday, Dec 16
8:30am – 11:30 am

Where: McCosh 28 (P01-P03) and 46 (P04-P08)

How: On paper. Closed book, but 1 two-sided study sheet allowed.

Why: Cumulative assessment. You've learned a lot, so show us!

Info: <https://www.cs.princeton.edu/courses/archive/fall25/cos217/exam2.php>
