3.1 SYMBOL TABLES

- ▶ *API*
- ▶ *elementary implementations*
- ▶ *ordered operations*

<https://algs4.cs.princeton.edu>

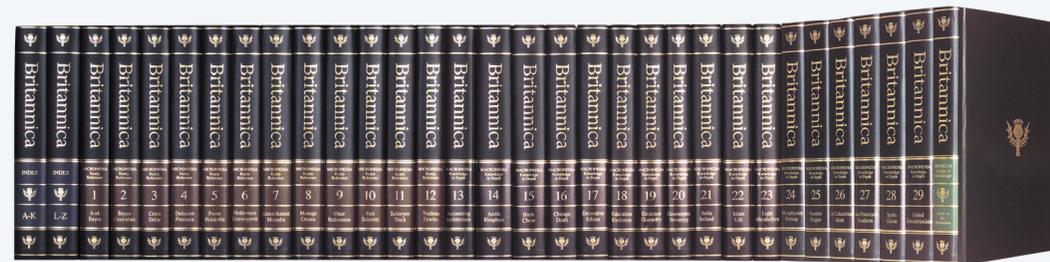

3.1 SYMBOL TABLES

- ▶ *API*
- ▶ *elementary implementations*
- ▶ *ordered operations*

Why are telephone books (and their cousins) obsolete?

Unsupported phone book operations.

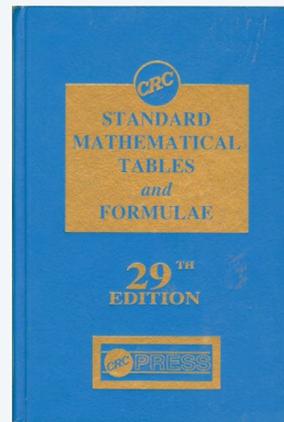

- **Add** a new name and associated number.
- **Remove** a given name and associated number.
- **Change** the number associated with a given name.

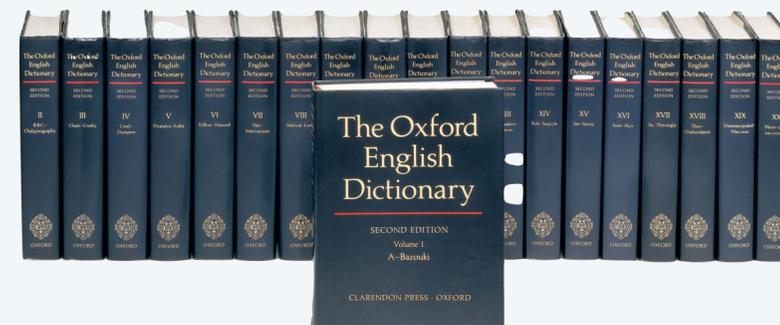

key = term
value = article

key = name
value = phone number

key = math function and input
value = function output

key = word
value = definition

key = time and channel
value = TV show

Symbol tables

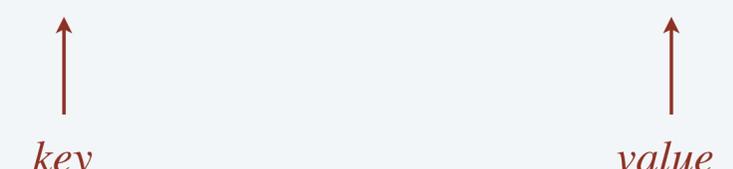

Key-value pair abstraction.

- **Insert** a value with specified key.
- Given a key, **search** for the corresponding value.

Ex. DNS lookup.

- Insert domain name with specified IP address.
- Given domain name, find corresponding IP address.

domain name	IP address
<i>www.cs.princeton.edu</i>	128.112.136.61
<i>goprincetontigers.com</i>	67.192.28.17
<i>wikipedia.com</i>	208.80.153.232
<i>google.com</i>	172.217.11.46

key *value*

Symbol table applications

application	purpose of search	key	value
dictionary	<i>find definition</i>	word	definition
book index	<i>find relevant pages</i>	term	list of page numbers
file share	<i>find song to download</i>	name of song	computer ID
financial account	<i>process transactions</i>	account number	transaction details
web search	<i>find relevant web pages</i>	keyword	list of page names
compiler	<i>find properties of variables</i>	variable name	type and value
routing table	<i>route Internet packets</i>	destination	best route
DNS	<i>find IP address</i>	domain name	IP address
reverse DNS	<i>find domain name</i>	IP address	domain name
genomics	<i>find markers</i>	DNA string	known positions
file system	<i>find file on disk</i>	filename	location on disk

Symbol tables: context

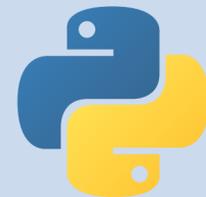

Also known as: maps, dictionaries, associative arrays.

Generalizes arrays. Keys need not be integers between 0 and $n - 1$.

Language support.

- External libraries: C, VisualBasic, Standard ML, bash, ...
- Built-in libraries: Java, C#, C++, Scala, Rust, ...
- Built-in to language: Python, Go, JavaScript, Swift, Ruby, Awk, Perl, PHP, Tcl, ...

```
has_nice_syntax_for_dictionaries['Python'] = True  
has_nice_syntax_for_dictionaries['Java'] = False
```

Python code

Basic symbol table API

Associative array abstraction. Associate key-value pairs.

two generic type parameters

```
public class ST<Key extends Comparable<Key>, Value>
```

	ST()	<i>create an empty symbol table</i>
void	put(Key key, Value val)	<i>insert key-value pair</i> ← a[key] = val;
Value	get(Key key)	<i>value paired with key</i> ← a[key]
Iterable<Key>	keys()	<i>all the keys in the symbol table</i>
boolean	contains(Key key)	<i>is there a value paired with key?</i>
void	delete(Key key)	<i>remove key (and associated value)</i>
boolean	isEmpty()	<i>is the symbol table empty?</i>
int	size()	<i>number of key-value pairs</i>

Conventions

- Method `put()` overwrites old value with new value.
- Method `get()` returns `null` if key not present.
- Values are not `null`. ← `java.util.Map` allows `null` values

“ Careless use of null can cause a staggering variety of bugs. Studying the Google code base, we found that something like 95% of collections weren’t supposed to have any null values in them, and having those fail fast rather than silently accept null would have been helpful to developers. ”

<https://code.google.com/p/guava-libraries/wiki/UsingAndAvoidingNullExplained>

Key and value types

Value type. Any generic type.

Key type. Different assumptions.

specify Comparable in API

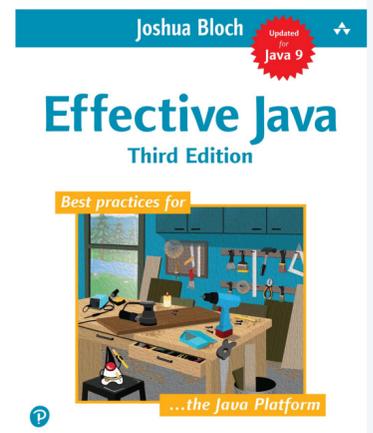

- This lecture: keys are `Comparable`; use `compareTo()`.
- Hashing lecture: keys are any generic type; use `equals()` to test equality and `hashCode()` to scramble key.

Best practices. Use immutable types for symbol-table keys.

immutable	mutable
String	StringBuilder
Integer	Stack
Double	ArrayList
Color	int[]
⋮	⋮

“Classes should be immutable unless there’s a very good reason to make them mutable.... If a class cannot be made immutable, you should still limit its mutability as much as possible.”

— Joshua Bloch (Java Collections architect)

ST test client for analysis

Frequency counter. Read a sequence of strings from standard input; print one that occurs most often.

```
~/cos226/st> more tinyTale.txt
```

```
it was the best of times  
it was the worst of times  
it was the age of wisdom  
it was the age of foolishness  
it was the epoch of belief  
it was the epoch of incredulity  
it was the season of light  
it was the season of darkness  
it was the spring of hope  
it was the winter of despair
```

```
~/cos226/st> java FrequencyCounter 3 < tinyTale.txt  
the 10
```

← *tiny example*
(60 words, 20 distinct)

```
~/cos226/st> java FrequencyCounter 8 < tale.txt  
business 10
```

← *real example*
(135,635 words, 10,769 distinct)

```
~/cos226/st> java FrequencyCounter 10 < leipzig1M.txt  
government 24763
```

← *real example*
(21,191,455 words, 534,580 distinct)

Frequency counter implementation

```
public class FrequencyCounter {  
    public static void main(String[] args) {  
        int minLength = Integer.parseInt(args[0]);
```

```
        ST<String, Integer> st = new ST<>();           compute frequencies  
        while (!StdIn.isEmpty()) {  
            String word = StdIn.readString();  
            if (word.length() < minLength) continue;  
            if (!st.contains(word)) st.put(word, 1);  
            else  
                st.put(word, st.get(word) + 1);  
        }
```

*overwrites old value
with new value
(no need to remove)*

```
        String champ = "";           identify and print a string with max frequency  
        st.put(champ, 0);  
        for (String word : st.keys()) {  
            if (st.get(word) > st.get(champ))  
                champ = word;  
        }  
        StdOut.println(champ + " " + st.get(champ));
```

*iterates over all
keys in symbol table*

```
    }  
}
```

3.1 SYMBOL TABLES

- ▶ *API*
- ▶ *elementary implementations*
- ▶ *ordered operations*

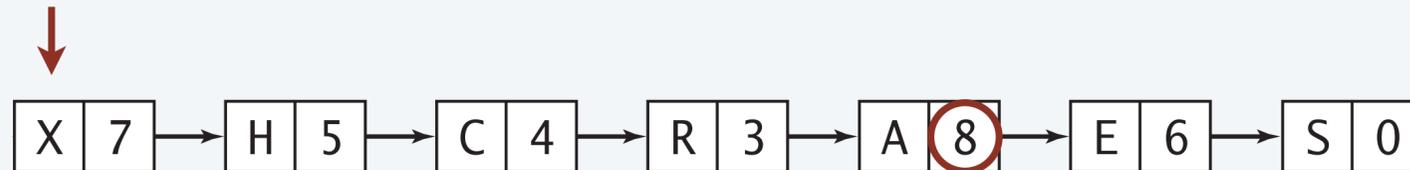

Sequential search in a linked list

Data structure. Maintain an (unordered) linked list of key-value pairs.

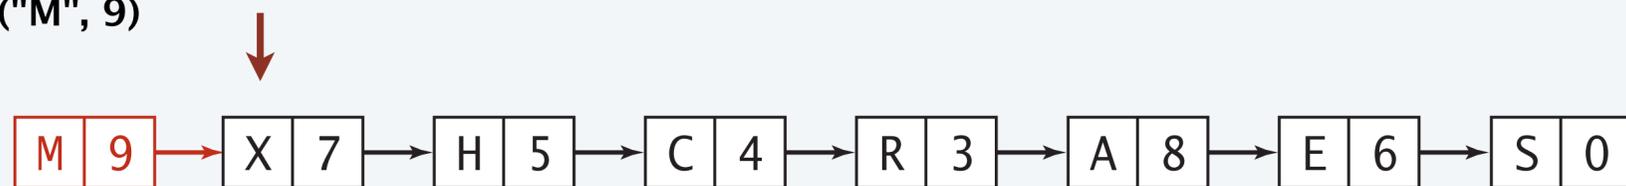

Search. Scan through all keys until finding a match.

Insert. Scan through all keys until finding a match; if no match add to front.

get("A")

put("M", 9)

Proposition. In the worst case, search and insert each take $\Theta(n)$ time.

Data structure. Maintain parallel arrays for keys and values, **sorted by key**.

keys[]										vals[]									
0	1	2	3	4	5	6	7	8	9	0	1	2	3	4	5	6	7	8	9
A	C	E	H	L	M	P	R	S	Z	8	4	2	5	11	9	10	3	0	7

What are the worst-case running times for **search** and **insert**, respectively?

- A. $\Theta(\log n)$ and $\Theta(\log n)$
- B. $\Theta(n)$ and $\Theta(\log n)$
- C. $\Theta(\log n)$ and $\Theta(n)$
- D. $\Theta(n)$ and $\Theta(n)$

Binary search in a sorted array

Data structure. Maintain parallel arrays for keys and values, **sorted by key**.

Search. Use **binary search** to find key.

Insert. Use binary search to find place to insert; shift all larger keys over.

get("P")

keys[]									
0	1	2	3	4	5	6	7	8	9
A	C	E	H	L	M	P	R	S	Z

vals[]									
0	1	2	3	4	5	6	7	8	9
8	4	2	5	11	9	10	3	0	7

put("P", 10)

keys[]									
0	1	2	3	4	5	6	7	8	9
A	C	E	H	M	R	S	X	-	-

vals[]									
0	1	2	3	4	5	6	7	8	9
8	4	6	5	9	3	0	7	-	-

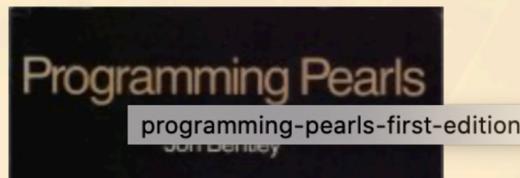

When I first submitted `BinarySearchDeLuxe.java` to TigerFile, the autograder identified a ...

- A. Correctness bug (false positive or false negative).
- B. Performance bug (or infinite loop).
- C. Both A and B.
- D. Neither A nor B.

Are you one of the 10% of programmers who can write a binary search? Apr 19

There are some programming books that I've read from cover to cover repeatedly; there are others that I have dipped into many times, reading a chapter or so at a time. Jon Bentley's 1986 classic *Programming Pearls* is a rare case where both of these are true, as the scuffs at the bottom of my copy's cover attest:

Elementary ST implementations: summary

implementation	worst case		operations on keys
	search	insert	
sequential search (unordered list)	n	n	<code>equals()</code>
binary search (sorted array)	$\log n$	n^\dagger	<code>compareTo()</code>

\dagger can do with $\Theta(\log n)$ compares, but still requires $\Theta(n)$ array accesses

Challenge. Efficient implementations of both search and insert.

<https://algs4.cs.princeton.edu>

3.1 SYMBOL TABLES

- ▶ *API*
- ▶ *elementary implementations*
- ▶ *ordered operations*

Examples of ordered symbol table API

	keys	values	
<code>min()</code> →	9:00:00	Chicago	
	9:00:03	Phoenix	
	9:00:13	Houston	← <code>get(9:00:13)</code>
	9:00:59	Chicago	
	9:01:10	Houston	
<code>floor(9:05:00)</code> →	9:03:13	Chicago	
	9:10:11	Seattle	
<code>select(7)</code> →	9:10:25	Seattle	
<code>rank(9:10:25) = 7</code>	9:14:25	Phoenix	
	9:19:32	Chicago	
	9:19:46	Chicago	
	9:21:05	Chicago	
	9:22:43	Seattle	
	9:22:54	Seattle	
	9:25:52	Chicago	
<code>ceiling(9:30:00)</code> →	9:35:21	Chicago	
	9:36:14	Seattle	
<code>max()</code> →	9:37:44	Phoenix	

Ordered symbol table API

Symbol table API. Add these ordered operations when keys are `Comparable`.

```
public class ST<Key extends Comparable<Key>, Value>
```

```
    :
```

```
    Key min()           smallest key
```

```
    Key max()          largest key
```

```
    Key floor(Key key) largest key less than or equal to key
```

```
    Key ceiling(Key key) smallest key greater than or equal to key
```

```
    int rank(Key key)  number of keys less than key
```

```
    Key select(int k)  key of rank k
```

Rank in a sorted array

Problem. Given a sorted array of n distinct keys, find the number of keys strictly less than a given query *key*.

Q. What if duplicate keys are allowed?

Ordered symbol table operations: performance summary

	sequential search	binary search	goal
<i>search</i>	$\Theta(n)$	$\Theta(\log n)$	$\Theta(\log n)$
<i>insert / delete</i>	$\Theta(n)$	$\Theta(n)$	$\Theta(\log n)$
<i>min / max</i>	$\Theta(n)$	$\Theta(1)$	$\Theta(\log n)$
<i>floor / ceiling</i>	$\Theta(n)$	$\Theta(\log n)$	$\Theta(\log n)$
<i>rank</i>	$\Theta(n)$	$\Theta(\log n)$	$\Theta(\log n)$
<i>select</i>	$\Theta(n)$	$\Theta(1)$	$\Theta(\log n)$

worst-case running time for ordered symbol table operations

Challenge. Efficient implementations of **all** operations, including **insertion/deletion**.
