

Intro to Networking

Intro to Layering

Network Layering

COS 316: Principles of Computer System Design

Lecture 6

Wyatt Lloyd

Intro to Networking

- How do I let two computers talk to each other?
 - If they are connected via a physical wire?
 - If they are in the same room?
 - If they are both on Princeton's campus?
 - If one is in Princeton and the other in Tokyo?
 - If one is in Princeton and the other is in Space?

Networking

- A series of layers and protocols and systems that allow machines to communicate with each other

Modularity Through Layering

- Systems on systems on systems through layering
- Each layer hides complexity with abstraction
- Network layers today!

The Problem of Communication

- **Re-implement every application** for every new underlying transmission medium?
- **Change every application** on any change to an underlying transmission medium?
- No! But how does the Internet design avoid this?

Solution: Layering

- Intermediate **layers** provide a set of abstractions for applications and media
- New applications or media need only implement for intermediate layer's interface

The Art of Layering

- How many layers?
- What goes in each layer?
- What abstraction (interface) does each layer provide?

Layering in the Internet

- **Transport:** Provide end-to-end communication between processes on different hosts
- **Network:** Deliver packets to destinations on other (heterogeneous) networks
- **Link:** Enables end hosts to exchange atomic messages with each other
- **Physical:** Moves bits between two hosts connected by a physical link

Logical Communication Between Layers

- How to forge agreement on the meaning of the bits exchanged between two hosts?
- **Protocol:** Rules that govern the format, contents, and meaning of messages
 - Each layer on a host interacts with its peer host's corresponding layer via the **protocol interface**

Physical communication

- Communication goes down to the **physical network**
- Then from **network** peer to peer
- Then up to the **relevant application**

Communication Between Peers

- How do peer protocols coordinate with each other?
- Layer attaches its own **header** (H) to communicate with peer
 - Higher layers' headers, data **encapsulated** inside message
 - Lower layers don't generally inspect higher layers' headers

Internet Protocol Layers

IP is the “Narrow Waist” of the Internet

- The network layer protocol
 - Enables portability above and below
- Lots of link layer protocols underneath
- Several transport protocols on top
 - TCP, UDP, QUIC

IP: Best-Effort Global Packet Delivery

- Never having to say you're sorry
 - Don't have to reserve bandwidth and memory
 - Don't have to do error detection and correction
 - Don't have to remember anything from one packet to the next
- Easier to survive failures
 - Transient disruptions are okay during failure recovery
- Can run on nearly any link technology
 - Greater interoperability and evolution
 - RFC 1149...

Transport: Application to Application

- Network layer is host-to-host
- Transport layer is port-on-host-to-port-on-host
 - think application to application
 - demultiplexing
 - e.g., port 80 is HTTP, port 443 is HTTPS, port 22 is SSH
- *Why transport and not network layer?*

Transport: Application to Application

- Network doesn't have error detection
- Transport layer does have error detection
- *Why transport and not network layer?*
- *Why not both?*

Transport: Transmission Control Protocol (TCP)

- Ordered, reliable stream of bytes
 - Built on top of best-effort packet delivery at the network layer
- Challenges with IP
 - Lost or delayed packets
 - Corrupted packets
 - Out-of-order packet arrivals
 - Receiver runs out of space
 - Network cannot handle current load

TCP: Lost or Delayed Packets

- Problem: Lost or delayed data
- Solution: Timeout and retransmit
 - Receiver sends acknowledgement of data

TCP: Corrupted Data

- Problem: Data corrupted during transmission
- Solution: checksums
- Sender computes a checksum
 - Sender sums up all bytes in the payload 134
 - And sends the sum to the receiver + 212 = 346
- Receiver checks a checksum
 - Receiver sums up all bytes in the payload + 216 134
 - And compares against the checksum = 350

Then what?

TCP: Out-of-Order Packet Arrivals

- Problem: Out of order packets:
 - Application: GET index.html
 - Sent packets: |GET| |inde| |x.ht| |ml|
 - Received packets: |ml| |inde| |x.ht| |GET|
- Solution: Add sequence numbers
 - Received packets at a high level:
 - |4|ml| |2|inde| |3|x.ht| |1|GET|
 - Received packets a bit more precisely (based on bytes):
 - |12|ml| |3|inde| |7|x.ht| |0|GET|

TCP: Receiver Runs Out of Space

- Problem: No more space to receive packets
- Solution: Flow control
 - Receiver maintains a window size
 - Amount of data it can buffer
 - Advertises window to the sender
 - Amount sender can send without acknowledgement
 - Ensures that sender does not send too much

TCP: Network that Cannot Handle the Load

- Problem: Too many packets at once
- Solution: Congestion control
 - Future lectures!

TCP's Reliable Byte Stream Example

Sender's application level buffer:

App ↑ "What is the best dining hall?"

OS ↓

Sender's outgoing TCP buffer:

0123456789... 28
What is the best dining hall?

Sender's outgoing IP buffer:

0:What is
7: the be
14:st dini
21:ng hall?

Receiver's application level buffer:

----- App ↑
OS ↓

Receiver's incoming TCP buffer:

Receiver's incoming IP buffer:

TCP's Reliable Byte Stream Example

Sender's application level buffer:

App ↑ "What is the best dining hall?"

OS ↓

Sender's outgoing TCP buffer:

0123456789... 28
What is the best dining hall?

Sender's outgoing IP buffer:

0:What is
7: the be
14:st dini
21:ng hall?

Receiver's application level buffer:

"What is" ----- App ↑
OS ↓

Receiver's incoming TCP buffer:

0123456789... 28
What is `

Receiver's incoming IP buffer:

App ↑ "What is the best dining hall?"

OS ↓

Sender's outgoing TCP buffer:

0123456789... 28
What is the best dining hall?

Sender's outgoing IP buffer:

Receiver's application level buffer:

App ↑ "What is the best dining hall?"

OS ↓

Receiver's incoming TCP buffer:

0123456789... 28
What is-the-best dining hall?

Receiver's incoming IP buffer:

7: the be

Transport: User Datagram Protocol (UDP)

- Datagram of bytes
 - A message

UDP does less than
TCP, why do we want
UDP too?

- Challenges with IP
 - Lost or delayed packets
 - Corrupted packets
 - Out-of-order packet arrivals
 - Receiver runs out of space
 - Network cannot handle current load

Layering & Network Layers Conclusion

- The art of layering
- Network layers
 - Protocol, headers, encapsulation
- IP layer: best-effort global packet delivery between host
- TCP layer: ordered, reliable byte stream between applications
