# Toy Example

D_1

weak classifiers = vertical or horizontal half-planes

# Round 1

h_1

D_2

$\varepsilon_1 = 0.30$

$\alpha_1 = 0.42$

Round 2

h_2

D_3

$\varepsilon_2 = 0.21$

$\alpha_2 = 0.65$
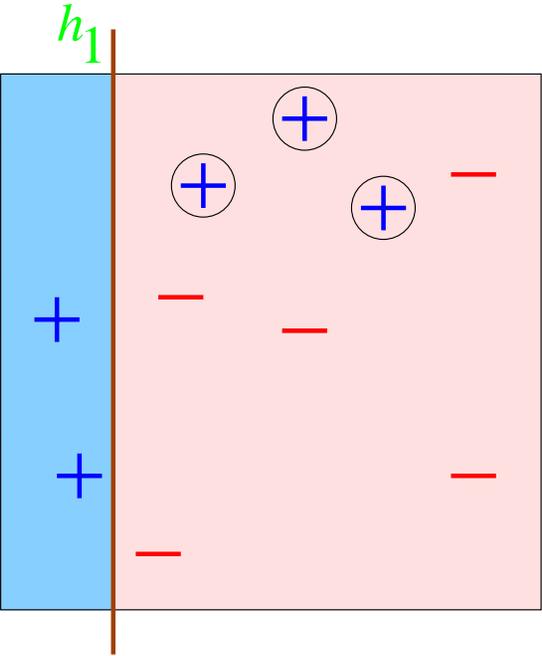

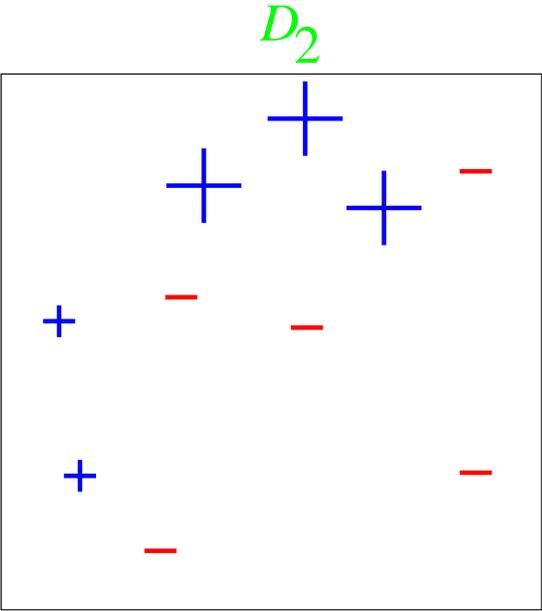

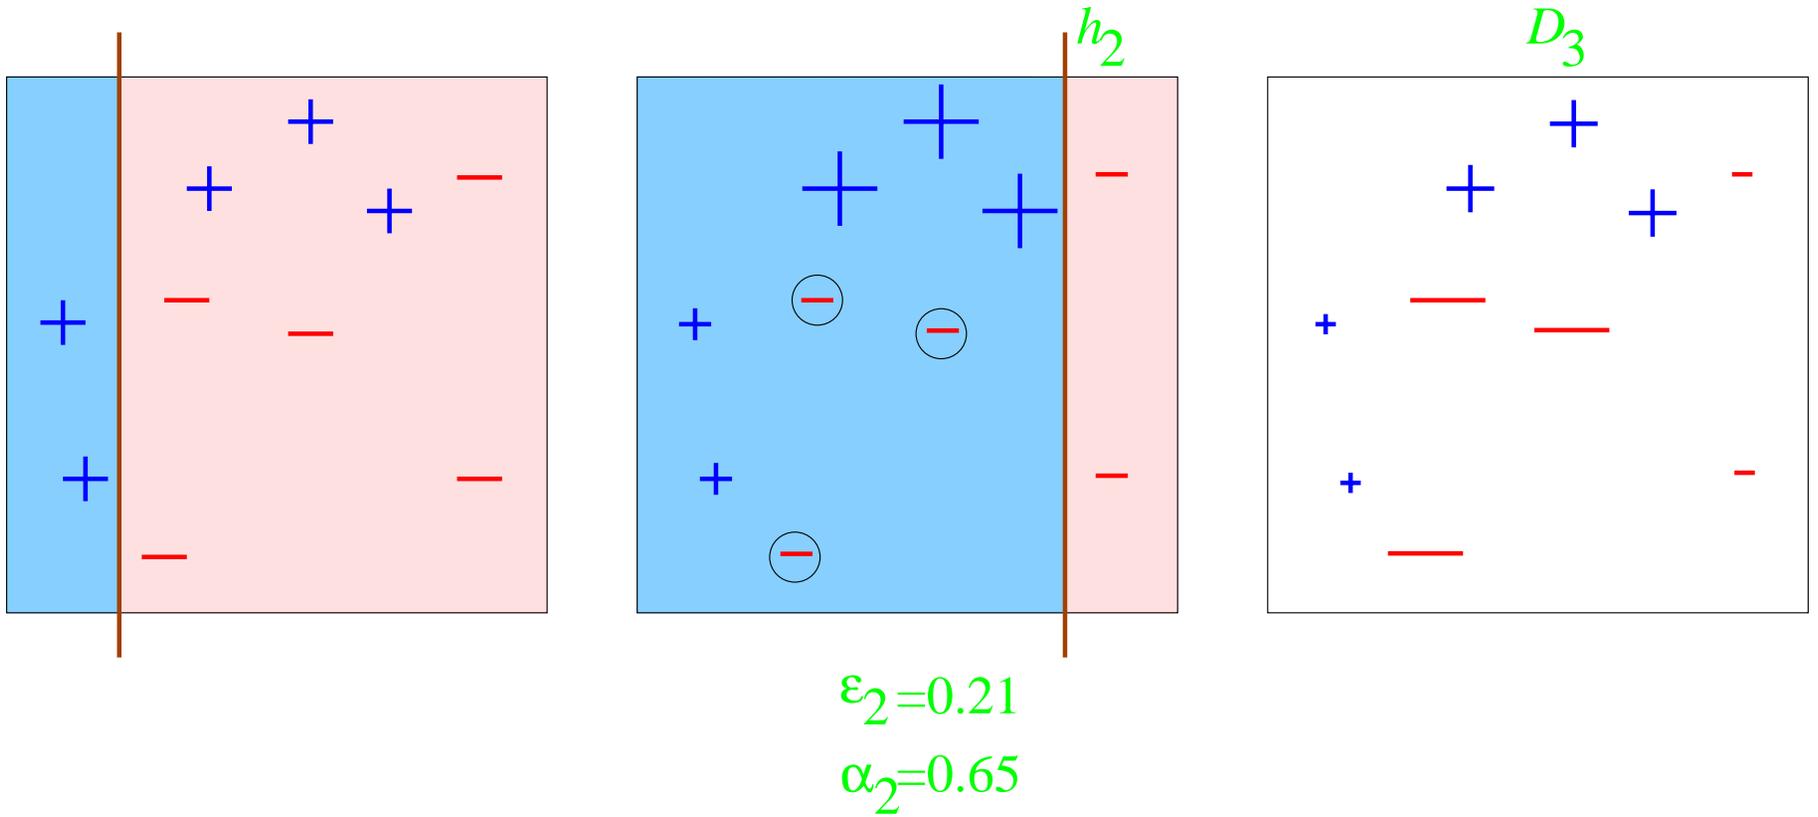

Round 3

h_3
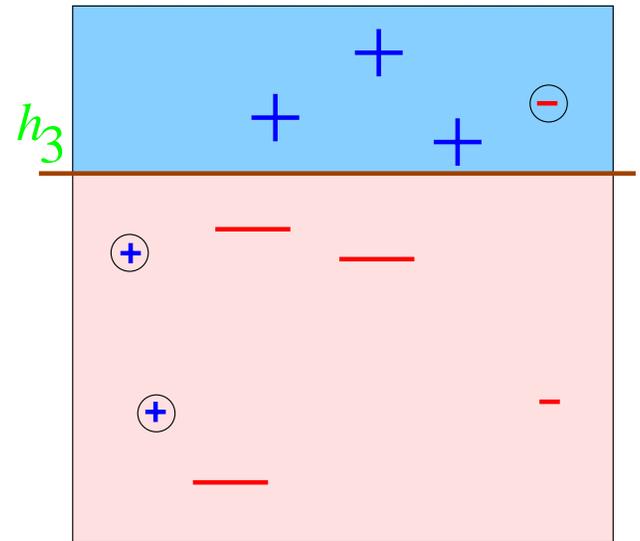

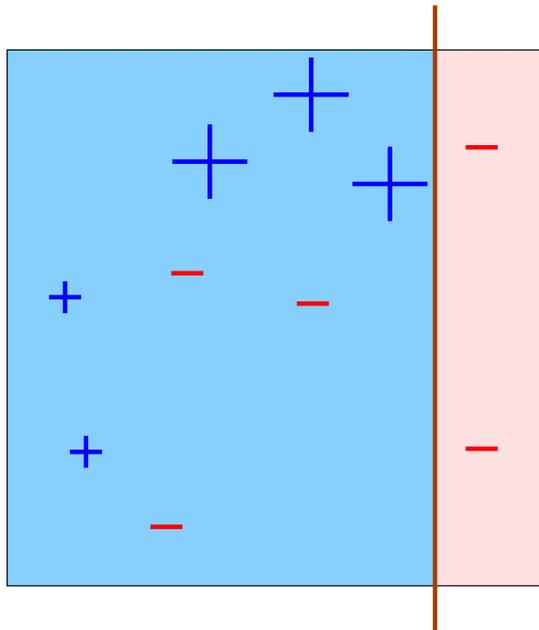

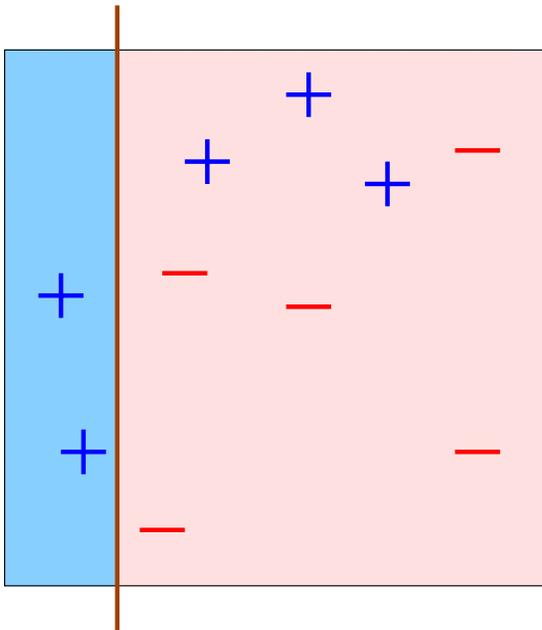

$\varepsilon_3 = 0.14$

$\alpha_3 = 0.92$

Final Classifier

$$H_{\text{final}} = \text{sign}\left(0.42 \quad \boxed{} \quad + 0.65 \quad \boxed{} \quad + 0.92 \quad \boxed{} \right)$$

$$=$$
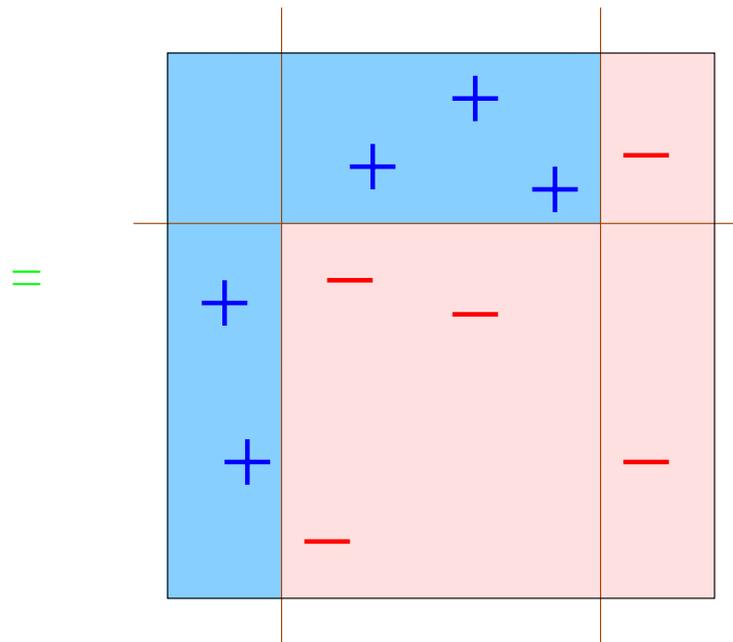

Actual Typical Run
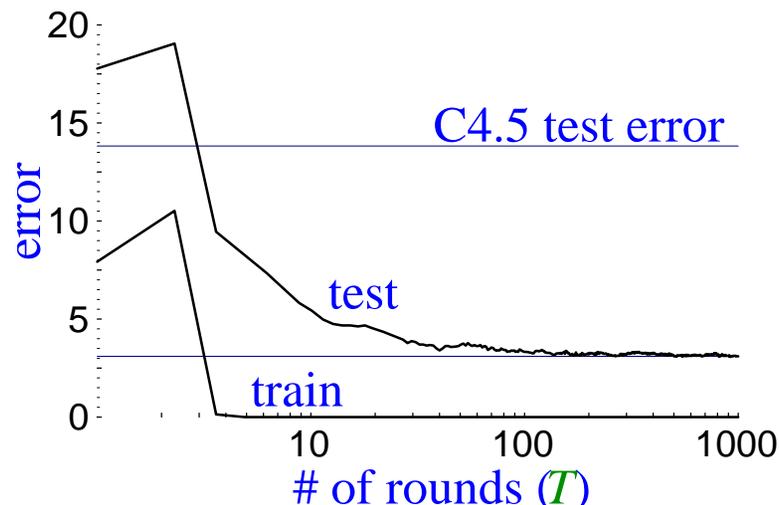

(boosting C4.5 on "letter" dataset)

- test error does <u>not</u> increase, even after 1000 rounds
  - (total size > 2,000,000 nodes)
- test error continues to drop even after training error is zero!

	# rounds		
	5	100	1000
train error	0.0	0.0	0.0
test error	8.4	3.3	3.1

- Occam's razor <u>wrongly</u> predicts "simpler" rule is better

Empirical Evidence: The Margin Distribution

- **margin distribution**
    = cumulative distribution of margins of training examples
	# rounds		
	5	100	1000
train error	0.0	0.0	0.0
test error	8.4	3.3	3.1
% margins ≤ 0.5	7.7	0.0	0.0
minimum margin	0.14	0.52	0.55
