

TOY II

LINC

Introduction to Computer Science · Sedgewick and Wayne · Copyright © 2007 · <http://www.cs.Princeton.EDU/IntroCS>

Data representation. Binary and hex.

TOY.

- Box with switches and lights.
- 16-bit memory locations, 16-bit registers, 8-bit pc.
- $4,328 \text{ bits} = (255 \times 16) + (15 \times 16) + (8) = 541 \text{ bytes!}$
- von Neumann architecture.

TOY instruction set architecture. 16 instruction types.

TOY machine language programs. Variables, arithmetic, loops.

2

What We Do Today

Data representation. Negative numbers.

Input and output. Standard input, standard output.

Manipulate addresses. References (pointers) and arrays.

TOY simulator in Java.

Negative Numbers

3

4

Adding and Subtracting Binary Numbers

Decimal and binary addition.

$$\begin{array}{r}
 013 \\
 + 092 \\
 \hline
 105
 \end{array}
 \qquad
 \begin{array}{r}
 \text{carries} \\
 \begin{array}{cccccccc}
 & & & & & 1 & 1 & \\
 & & & & & 1 & 1 & \\
 0 & 0 & 0 & 0 & 1 & 1 & 0 & 1 \\
 + & 0 & 1 & 0 & 1 & 1 & 1 & 0 & 0 \\
 \hline
 0 & 1 & 1 & 0 & 1 & 0 & 0 & 1
 \end{array}
 \end{array}$$

Subtraction. Add a negative integer.

e.g., $6 - 4 = 6 + (-4)$

Q. How to represent negative integers?

Representing Negative Integers

TOY words are 16 bits each.

- We could use 16 bits to represent 0 to $2^{16} - 1$.
- We want negative integers too.
- Reserving half the possible bit-patterns for negative seems fair.

Highly desirable property. If x is an integer, then the representation of $-x$, when added to x , is zero.

$$\begin{array}{r}
 x \\
 + (-x) \\
 \hline
 0
 \end{array}
 \qquad
 \begin{array}{r}
 00110100 \\
 + \text{????????} \\
 \hline
 00000000
 \end{array}$$

$$\begin{array}{r}
 x \\
 + (-x) \\
 \hline
 0
 \end{array}
 \qquad
 \begin{array}{r}
 00110100 \\
 + 11001011 \\
 \hline
 11111111 \\
 + 1 \\
 \hline
 00000000
 \end{array}$$

flip bits and add 1

5

6

Two's Complement Integers

To compute $-x$ from x :

- Start with x .

$$\begin{array}{r}
 +4 \\
 0000000000000001000
 \end{array}$$

leading bit

- Flip bits.

$$\begin{array}{r}
 -5 \\
 11111111111111011
 \end{array}$$

- Add one.

$$\begin{array}{r}
 -4 \\
 11111111111111000
 \end{array}$$

Two's Complement Integers

dec	hex	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

7

8

Properties of Two's Complement Integers

Properties.

- Leading bit (bit 15) signifies sign.
- 0000000000000000 represents zero.
- Negative integer $-x$ represented by $2^{16} - x$.
- Addition is easy.
- Checking for arithmetic overflow is easy.

Not-so-nice property. Can represent one more negative integer than positive integer.

32,768 = 2^{15}

-32,768 = -2^{15}

Standard Input and Output

Standard Output

Standard output.

- Writing to memory location `FF` sends one word to TOY stdout.
- Ex. `9AFF` writes the integer in register `A` to stdout.

```

00: 0000 0
01: 0001 1

10: 8A00 RA ← mem[00]      a = 0
11: 8B01 RB ← mem[01]      b = 1

12: 9AFF write RA to stdout   print a
13: 1AAB RA ← RA + RB       a = a + b
14: 2BAB RB ← RA - RB       b = a - b
15: DA12 if (RA > 0) goto 12
16: 0000 halt
    
```

fibonacci.toy

```

0000
0001
0001
0002
0003
0005
0008

0A18
1055
1A6D
2AC2
452F
6FF1
    
```

11

Standard Input

Standard input.

- Loading from memory address `FF` loads one word from TOY stdin.
- Ex. `8AFF` reads an integer from stdin and store it in register `A`.

Ex: read in a sequence of integers and print their sum.

- In Java, stop reading when EOF.
- In TOY, stop reading when user enters `0000`.

```

while (!StdIn.isEmpty()) {
    a = StdIn.readInt();
    sum = sum + a;
}
StdOut.println(sum);
    
```

```

00: 0000 0
10: 8C00 RC ← mem[00]
11: 8AFF read RA from stdin
12: CA15 if (RA == 0) pc ← 15
13: 1CCA RC ← RC + RA
14: C011 pc ← 11
15: 9CFF write RC
16: 0000 halt
    
```

```

00AE
0046
0003
0000
00F7
    
```

12

Standard Input and Output: Implications

Standard input and output enable you to:

- Get information out of machine.
- Put information from real world into machine.
- Process more information than fits in memory.
- Interact with the computer while it is running.

13

Pointers

14

Load Address (a.k.a. Load Constant)

Load address. [opcode 7]

- Loads an 8-bit integer into a register.
- $7A30$ means load the value 30 into register A.

Applications.

- Load a small **constant** into a register.
- Load a 8-bit **memory address** into a register.

```
a = 0x30;
```

Java code

register stores "pointer" to a memory cell

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
0	1	1	1	1	0	1	0	0	0	1	1	0	0	0	0
7 ₁₆				A ₁₆				3 ₁₆				0 ₁₆			
opcode				dest d				addr							

15

Arrays in TOY

TOY main memory is a giant array.

- Can access memory cell 30 using load and store.
- $8C30$ means load $mem[30]$ into register C.
- **Goal:** access memory cell i where i is a variable.

...	...
30	0000
31	0001
32	0001
33	0002
34	0003
35	0005
36	0008
37	000D
...	...

TOY memory

Load indirect. [opcode A] ← a variable index

- $AC06$ means load $mem[R6]$ into register C.

Store indirect. [opcode B]

- $BC06$ means store contents of register C into $mem[R6]$. ← a variable index

```
for (int i = 0; i < N; i++)
    a[i] = StdIn.readInt();

for (int i = 0; i < N; i++)
    StdOut.println(a[N-i-1]);
```

16

TOY Implementation of Reverse

TOY implementation of reverse.

- Read in a sequence of integers and store in memory 30, 31, 32, ...
- Stop reading if 0000.
- Print sequence in reverse order.

```

10: 7101 R1 ← 0001      constant 1
11: 7A30 RA ← 0030      a[]
12: 7B00 RB ← 0000      n

13: 8CFF read RC          while(true) {
14: CC19 if (RC == 0) goto 19   c = StdIn.readInt();
15: 16AB R6 ← RA + RB         if (c == 0) break;
16: BC06 mem[R6] ← RC         memory address of a[n]
17: 1BB1 RB ← RB + R1         a[n] = c;
18: C013 goto 13             n++;
                                }

```

read in the data

17

TOY Implementation of Reverse

TOY implementation of reverse.

- Read in a sequence of integers and store in memory 30, 31, 32, ...
- Stop reading if 0000.
- Print sequence in reverse order.

```

19: CB20 if (RB == 0) goto 20   while (n > 0) {
1A: 16AB R6 ← RA + RB         address of a[n]
1B: 2661 R6 ← R6 - R1         address of a[n-1]
1C: AC06 RC ← mem[R6]         c = a[n-1];
1D: 9CFF write RC             StdOut.println(c);
1E: 2BB1 RB ← RB - R1         n--;
1F: C019 goto 19             }
20: 0000 halt

```

print in reverse order

18

Unsafe Code at any Speed

- Q. What happens if we make array start at 00 instead of 30?
- A. Self modifying program; can overflow buffer and run arbitrary code!

```

10: 7101 R1 ← 0001      constant 1
11: 7A00 RA ← 0000      a[]
12: 7B00 RB ← 0000      n

13: 8CFF read RC          while(true) {
14: CC19 if (RC == 0) goto 19   c = StdIn.readInt();
15: 16AB R6 ← RA + RB         if (c == 0) break;
16: BC06 mem[R6] ← RC         memory address of a[n]
17: 1BB1 RB ← RB + R1         a[n] = c;
18: C013 goto 13             n++;
                                }

```

```

% more crazy8.txt
1 1 1 1 1 1 1 1
1 1 1 1 1 1 1 1
8888 8810
98FF C011

```

19

What Can Happen When We Lose Control (in C or C++)?

Buffer overrun.

- Array `buffer[]` has size 100.
- User might enter 200 characters.
- Might lose control of machine behavior.

```

#include <stdio.h>
int main(void) {
    char buffer[100];
    scanf("%s", buffer);
    printf("%s\n", buffer);
    return 0;
}

```

unsafe C program

Consequences. Viruses and worms.

Java enforces security.

- Type safety.
- Array bounds checking.
- Not foolproof.

shine 50W bulb at DRAM
[Appel-Govindavajhala '03]

20

Buffer Overrun Example: JPEG of Death

Microsoft Windows JPEG bug. [September, 2004]

- Step 1. User views malicious JPEG in IE or Outlook.
- Step 2. Machine is Owned.
- Data becomes code by exploiting buffer overrun in GDI+ library.

Fix. Update old library with patched one.

but many applications install independent copies of GDI library

Moral.

- Not easy to write error-free software.
- Embrace Java security features.
- Don't try to maintain several copies of the same file.
- Keep your OS patched.

Dumping

Q. Work all day to develop operating system. How to save it?

A. Write short program `dump.toy` and run it to dump contents of memory onto tape.

```
00: 7001 R1 ← 0001
01: 7210 R2 ← 0010      i = 10
02: 73FF R3 ← 00FF

                                do {
03: AA02 RA ← mem[R2]      a = mem[i]
04: 9AFF write RA          print a
05: 1221 R2 ← R2 + R1      i++
06: 2432 R4 ← R3 - R2
07: D403 if (R4 > 0) goto 03 } while (i < 255)
08: 0000 halt
```

`dump.toy`

21

22

Booting

Q. How do you get it back?

A. Write short program `boot.toy` and run it to read contents of memory from tape.

```
00: 7001 R1 ← 0001
01: 7210 R2 ← 0010      i = 10
02: 73FF R3 ← 00FF

                                do {
03: 8AFF read RA          read a
04: BA02 mem[R2] ← RA      mem[i] = a
05: 1221 R2 ← R2 + R1      i++
06: 2432 R4 ← R3 - R2
07: D403 if (R4 > 0) goto 03 } while (i < 255)
08: 0000 halt
```

`boot.toy`

23

24

TOY Simulator

TOY Simulator

Goal. Write a program to "simulate" the behavior of the TOY machine.

- TOY simulator in Java.
- TOY simulator in TOY!

```
public class TOY {
    public static void main(String[] args) {
        int pc = 0x10; // program counter
        int[] R = new int[16]; // registers
        int[] mem = new int[256]; // main memory

        // READ IN .toy FILE

        while (true) {
            // FETCH INSTRUCTION and DECODE
            ...
            // EXECUTE
            ...
        }
    }
}

% java TOY add-stdin.toy
A012
002B
A03D
```

25

TOY Simulator: Fetch

Fetch. Extract destination register of 1_{CAB} by shifting and masking.

0	0	0	1	1	1	0	0	1	0	1	0	1	0	1	1	inst
1 ₁₆				C ₁₆				A ₁₆				B ₁₆				
0	0	0	0	0	0	0	0	0	0	0	1	1	1	0	0	inst >> 8
0 ₁₆				0 ₁₆				1				C ₁₆				
0	0	0	0	0	0	0	0	0	0	0	1	1	1	1		15
0 ₁₆				0 ₁₆				0 ₁₆				F ₁₆				
0	0	0	0	0	0	0	0	0	0	0	0	1	1	0	0	(inst >> 8) & 15
0 ₁₆				0 ₁₆				0				C ₁₆				

```
int inst = mem[pc++]; // fetch and increment
int op = (inst >> 12) & 15; // opcode (bits 12-15)
int d = (inst >> 8) & 15; // dest d (bits 08-11)
int s = (inst >> 4) & 15; // source s (bits 04-07)
int t = (inst >> 0) & 15; // source t (bits 00-03)
int addr = (inst >> 0) & 255; // addr (bits 00-07)
```

26

TOY Simulator: Execute

```
if (op == 0) break; // halt

switch (op) {
    case 1: R[d] = R[s] + R[t]; break;
    case 2: R[d] = R[s] - R[t]; break;
    case 3: R[d] = R[s] & R[t]; break;
    case 4: R[d] = R[s] ^ R[t]; break;
    case 5: R[d] = R[s] << R[t]; break;
    case 6: R[d] = R[s] >> R[t]; break;
    case 7: R[d] = addr; break;
    case 8: R[d] = mem[addr]; break;
    case 9: mem[addr] = R[d]; break;
    case 10: R[d] = mem[R[t]]; break;
    case 11: mem[R[t]] = R[d]; break;
    case 12: if (R[d] == 0) pc = addr; break;
    case 13: if (R[d] > 0) pc = addr; break;
    case 14: pc = R[d]; break;
    case 15: R[d] = pc; pc = addr; break;
}
```

27

TOY Simulator: Omitted Details

Omitted details.

- Register 0 is always 0.
 - reset $R[0]=0$ after each fetch-execute step
- Standard input and output.
 - if $addr$ is FF and opcode is load (indirect) then read in data
 - if $addr$ is FF and opcode is store (indirect) then write out data
- TOY registers are 16-bit integers; program counter is 8-bit.
 - Java `int` is 32-bit; Java `short` is 16-bit
 - use casts and bit-whacking

Complete implementation. See `TOY.java` on booksite.

28

Simulation

Consequences of simulation.

- Test out new machine or microprocessor using simulator.
 - cheaper and faster than building actual machine
- Easy to add new functionality to simulator.
 - trace, single-step, breakpoint debugging
 - simulator more useful than TOY itself
- Reuse software from old machines.

Ancient programs still running on modern computers.

- Ticketron.
- Lode Runner on Apple IIe.

29

Backwards Compatibility

- Q. Why is standard US rail gauge 4 feet, 8.5 inches?

30
