

Goals of this Lecture

Help you learn about:

• The memory / storage hierarchy
• Locality and caching
• Virtual memory
• How the hardware and OS give application programs the illusion of a large, contiguous, private address space

Virtual memory is one of the most important concepts in system programming

2

Typical Storage Hierarchy

Smaller

Level 3 cache

Level 3 cache

Level 3 cache

Level 3 cache

Main memory holds disk bloks retrieved from lain memory disks bloks retrieved from local disks on retrieved from disks on remote network servers

Local disks hold flies retrieved from disks on remote network servers

remote secondary storage (distributed file systems, Web servers)

4

Factors to consider:

Capacity
Latency (how long to do a read)
Bandwidth (how many bytes/sec can be read)
Weakly correlated to latency: reading 1 MB from a hard disk isn't much slower than reading 1 byte
Volatility
Do data persist in the absence of power?

Registers

Latency: 0 cycles

Capacity: 8-256 registers (31 general purpose registers in AArch64)

L1/L2/L3 Cache

Latency: 1 to 40 cycles

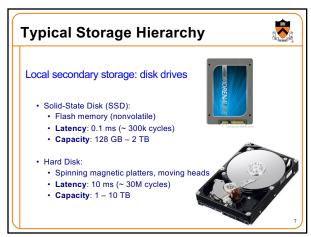

Capacity: 32KB to 32MB

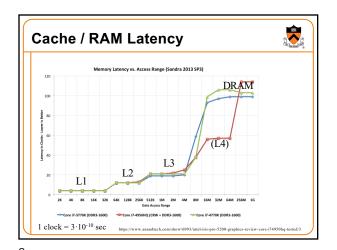

Main memory (RAM)

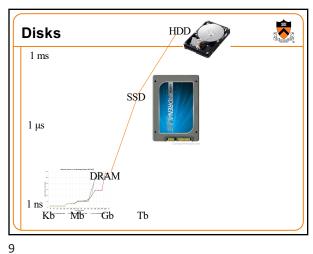

Latency: ~ 50-100 cycles

100 times slower than registers

Capacity: GB

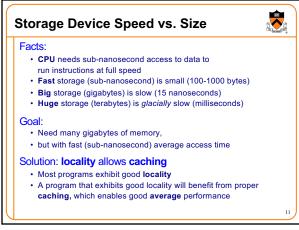

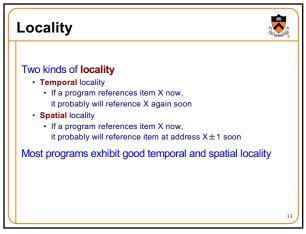

**Typical Storage Hierarchy** Remote secondary storage (a.k.a. "the cloud") • Latency: tens of milliseconds · Limited by network bandwidth Capacity: essentially unlimited

10

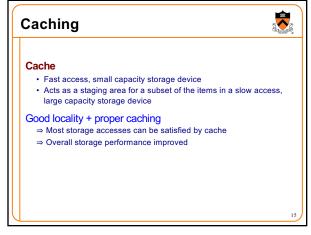

Agenda Typical storage hierarchy Locality and caching Virtual memory

11 12

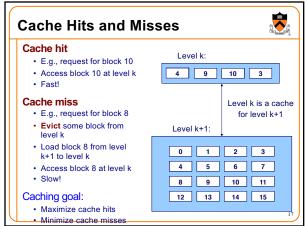

14

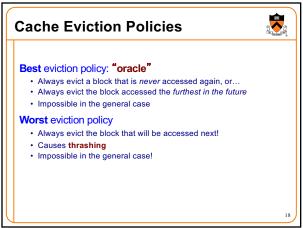

16

Caching in a Storage Hierarchy Level k: Smaller, faster device at 4 9 10 3 level k caches a subset of the blocks from level k+1 Blocks copied between levels Level k+1: 0 1 2 3 Larger, slower device at 4 5 6 7 level k+1 is partitioned 8 9 10 11 into blocks 12 13 14 15

15

Locality/Caching Example: Matrix Mult

Matrix multiplication

• Matrix = two-dimensional array

• Multiply n-by-n matrices A and B

• Store product in matrix C

Performance depends upon

• Effective use of caching (as implemented by system)

• Good locality (as implemented by you)

20

22

19

Locality/Caching Example: Matrix Mult Two-dimensional arrays are stored in either row-major or column-major order col-major row-major 18 a[0][0] 18 a[0][0] 19 a[1][0] 21 24 a[0][1] a[0][2] 20 a[2][0] 19 a[1][0] a[0][1] 21 a[1][1] 22 a[1][1] 22 a[1][2] 23 a[2][1] 25 a[2][0] 24 a[0][2] 20 a[2][1] 25 a[1][2] 23 a[2][2] 26 a[2][2] 26 C uses row-major order Access in row-major order ⇒ good spatial locality Access in column-major order ⇒ poor spatial locality

Locality/Caching Example: Matrix Mult

for (i=0; i<n; i++)
for (j=0; j<n; j++)
for (k=0; k<n; k++)
c[i][j] += a[i][k] \* b[k][j];

Reasonable cache effects

• Good locality for A

• Bad locality for B

• Good locality for C

a

b

c

21

Locality/Caching Example: Matrix Mult

for (j=0; j<n; j++)
for (k=0; k<n; k++)
for (i=0; i<n; i++)
c[i][j] += a[i][k] \* b[k][j];

Poor cache effects

Bad locality for A

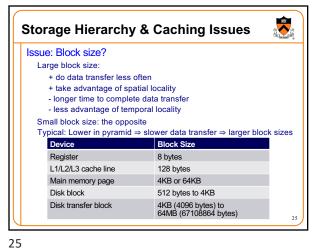

Bad locality for B

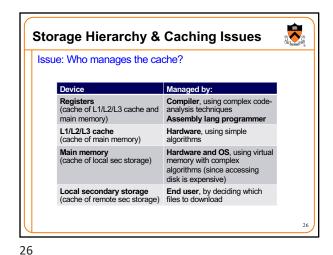

Bad locality for C

Locality/Caching Example: Matrix Mult

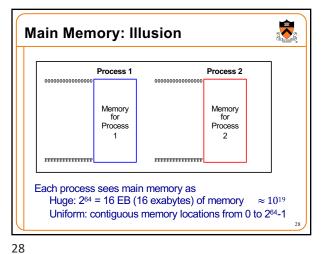

for (i=0; i<n; i++)
for (k=0; k<n; k++)
for (j=0; j<n; j++)
c[i][j] += a[i][k] \* b[k][j];

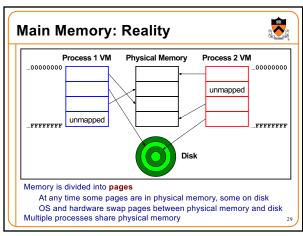

Good cache effects
Good locality for A
Good locality for B
Good locality for C

Translation Lookaside Buffer

Translation lookaside buffer (TLB)

• Small cache on CPU

• Each TLB entry consists of a page table entry

• Hardware first consults TLB

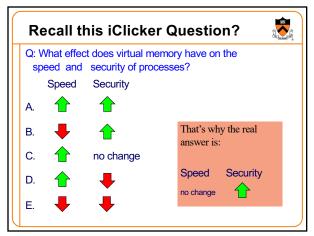

• Hit → no need to consult page table in L1/L2/L3 cache or memory

• Miss ⇒ swap relevant entry from page table in L1/L2/L3 cache or memory into TLB; try again

• See Bryant & O'Hallaron book for details

Caching again!!!

51

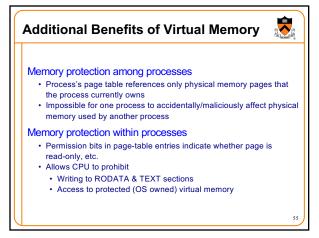

Additional Benefits of Virtual Memory

Virtual memory concept facilitates/enables many other
OS features; examples...

Context switching (as described last lecture)

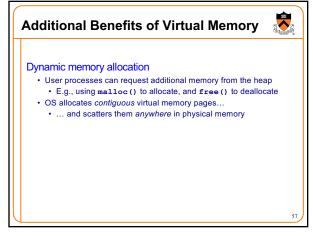

• Illusion: To context switch from process X to process Y, OS must save contents of registers and memory for process X, restore contents of registers and memory for process Y

• Reality: To context switch from process X to process Y, OS must save contents of registers and virtual memory for process X, restore contents of registers and virtual memory for process X to process X, restore contents of registers and pointer to the page table for process X, restore contents of registers and pointer to the page table for process X, restore contents of registers and pointer to the page table for process X

Additional Benefits of Virtual Memory Linking · Same memory layout for each process • E.g., TEXT section always starts at virtual addr 0x400000 · Linker is independent of physical location of code Code and data sharing · User processes can share some code and data • E.g., single physical copy of stdio library code (e.g. printf) · Mapped into the virtual address space of each process

55

Additional Benefits of Virtual Memory

## Creating new processes

56

58

- · Easy for "parent" process to "fork" a new "child" process
  - Initially: make new PCB containing copy of parent page table
- · Incrementally: change child page table entries as required · See Process Management lecture for details
- fork() system-level function

## Overwriting one program with another

- Easy for a process to replace its program with another program
  - · Initially: set page table entries to point to program pages that already exist on disk!
- · Incrementally: swap pages into memory as required
- See Process Management lecture for details

• execvp () system-level function

57

**Measuring Memory Usage** UID PID PPID PRI NI VSZ RSS WCHAN STAT TTY 42579 9655 9696 30 10 167568 13840 signal TN pts/1 0 42579 9696 9695 30 10 24028 2072 wait SNs pts/1 0 42579 9725 9696 30 10 11268 956 - RN+ pts/1 VSZ (virtual memory size): virtual memory usage RSS (resident set size): physical memory usage (both measured in kilobytes)

Summary Locality and caching · Spatial & temporal locality Good locality ⇒ caching is effective Typical storage hierarchy • Registers, L1/L2/L3 cache, main memory, local secondary storage (esp. disk), remote secondary storage Virtual memory · Illusion vs. reality · Implementation · Virtual addresses, page tables, translation lookaside buffer (TLB) · Additional benefits (many!) Virtual memory concept permeates the design of operating systems and computer hardware
