

Bitcoin and the Blockchain

COS 418: Distributed Systems
Lecture 21

Mike Freedman

1

Bitcoin: 10,000 foot view

- New bitcoins are “created” every ~10 min, owned by “miner” (more on this later)
- Thereafter, just keep record of transfers
 - e.g., Alice pays Bob 1 BTC
- Basic protocol:
 - Alice signs transaction: $txn = \text{Sign}_{\text{Alice}}(\text{BTC}, \text{PK}_{\text{Bob}})$
 - Alice shows transaction to others...

2

2

Problem: Equivocation!

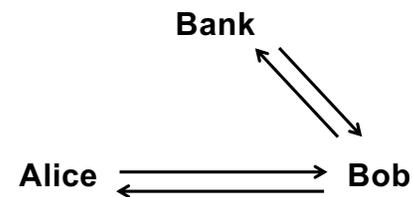

Can Alice “pay” both Bob and Charlie with same bitcoin ?

(Known as “double spending”)

3

3

How traditional e-cash handled problem

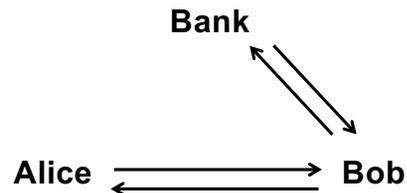

- When Alice pays Bob with a coin, Bob validates that coin hasn't been spend with trusted third party
- Introduced “blind signatures” and “zero-knowledge protocols” so bank can't link withdrawals and deposits

4

4

How traditional e-cash handled problem

- When Alice pays Bob with a coin, Bob validates that coin hasn't been spend with trusted third party

Bank maintains linearizable log of transactions

5

5

Problem: Equivocation!

Goal: No double-spending in decentralized environment

Approach: Make transaction log

1. public
2. append-only
3. strongly consistent

6

6

Bitcoin: 10,000 foot view

- Public
 - Transactions are signed: $\text{txn} = \text{Sign}_{\text{Alice}}(\text{BTC}, \text{PK}_{\text{Bob}})$
 - All transactions are sent to all network participants
- No equivocation: Log append-only and consistent
 - All transactions part of a hash chain
 - Consensus on set/order of operations in hash chain

7

7

Cryptography Hash Functions

- Take message m of arbitrary length and produces fixed-size (short) number $H(m)$
 - e.g., *SHA-1 produces 160-bit output, SHA-256 has 256-bit output*
- One-way function
 - **Efficient:** Easy to compute $H(m)$
 - **Hiding property:** Hard to find an m , given $H(m)$
- Collision resistance:
 - **Strong resistance:** Find any $m \neq m'$ such that $H(m) == H(m')$
 - **Weak resistance:** Given m , find m' such that $H(m) == H(m')$

8

8

Tamper-evident logging

9

Blockchain: Append-only hash chain

- Hash chain creates “tamper-evident” log of txns
- Security based on collision-resistance of hash function
 - Given m and $h = \text{hash}(m)$, difficult to find m' such that $h = \text{hash}(m')$ and $m \neq m'$

10

Blockchain: Append-only hash chain

Bitcoin: A Peer-to-Peer Electronic Cash System

Satoshi Nakamoto
satoshi@bitcointalk.org
www.bitcoin.org

Abstract. A purely peer-to-peer version of electronic cash would allow online payments to be sent directly from one party to another without going through a financial institution. Digital signatures provide part of the solution, but the main

11

Problem remains: forking

12

Goal: Consensus

- Fault-tolerant protocols to achieve consensus of replicated log with **malicious** participants
 - Requires: $n \geq 3f + 1$ nodes, at most f faulty
- Problem
 - Communication complexity is n^2
 - Requires **strong view** of network participants

13

13

Consensus susceptible to “Sybils”

- Traditional consensus protocols based on membership
 - ... assume independent failures ...
 - ... which implies strong notion of identity
- “Sybil attack” (p2p literature ~2002)
 - **Idea**: one entity can create many “identities” in system
 - **Typical defense**: 1 IP address = 1 identity
 - **Problem**: IP addresses aren’t difficult / expensive to get, esp. in world of botnets & cloud services

14

14

Consensus based on “work”

- Rather than “count” IP addresses, bitcoin “counts” the amount of CPU time / electricity that is expended

“The system is secure as long as honest nodes collectively control more CPU power than any cooperating group of attacker nodes.”

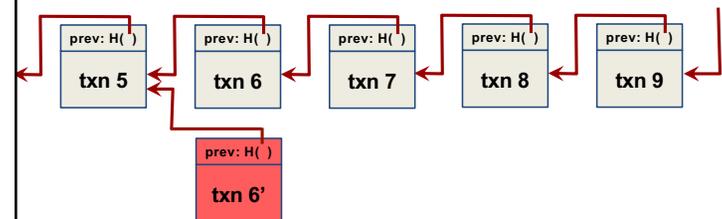

- Satoshi Nakamoto

- Proof-of-work: Cryptographic “proof” that certain amount of CPU work was performed

15

15

Key idea: Chain length requires work

- Generating a new block requires “proof of work”
- “Correct” nodes accept longest chain
- Creating fork requires rate of malicious work \gg rate of correct
 - So, the older the block, the “safer” it is from being deleted

16

16

Use hashing to determine work!

- Recall hash functions are one-way / collision resistant
 - Given h , hard to find m such that $h = \text{hash}(m)$
- But what about finding partial collision?
 - m whose hash has most significant bit = 0?
 - m whose hash has most significant bit = 00?
 - Assuming output is randomly distributed, complexity grows exponentially with # bits to match

17

17

Bitcoin proof of work

Find **nonce** such that

$$\text{hash}(\text{nonce} \parallel \text{prev_hash} \parallel \text{block data}) < \text{target}$$

i.e., hash has certain number of leading 0's

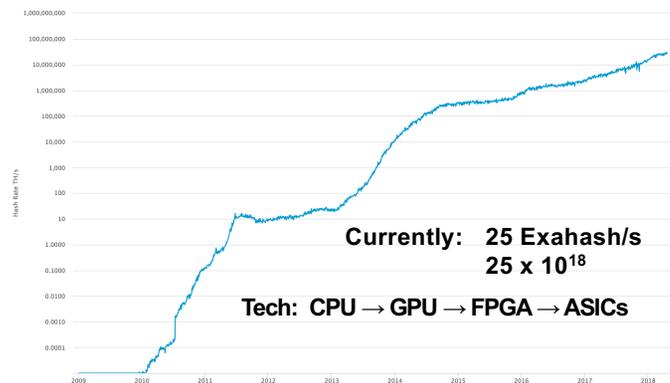

What about changes in total system hashing rate?

- Target is recalculated every 2 weeks
- Goal: One new block every 10 minutes

18

18

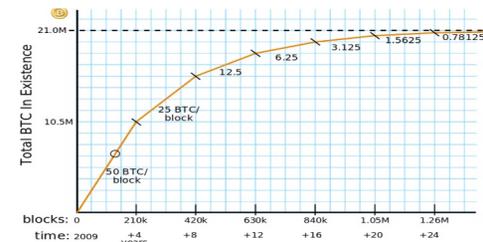

Historical hash rate trends of bitcoin

19

19

Why consume all this energy?

- Creating a new block creates bitcoin!
 - Initially 50 BTC, decreases over time, currently 3.125
 - Last halving on April 19, 2024
 - Block height is 840,281 as of 4-21-2024
 - New bitcoin assigned to party named in new block
 - Called "mining" as you search for gold/coins

20

20

Bitcoin is worth (LOTS OF) money!

3.125 BTC = ~\$202,800 today

21

21

Incentivizing correct behavior?

- Race to find nonce and claim block reward, at which time race starts again for next block

hash (nonce || prev_hash || block data)

- As solution has prev_hash, corresponds to particular chain
- Correct behavior is to accept longest chain
 - “Length” determined by aggregate work, not # blocks
 - So miners incentivized only to work on longest chain, as otherwise solution not accepted
 - Remember blocks on other forks still “create” bitcoin, but only matters if chain in collective conscious (majority)

22

22

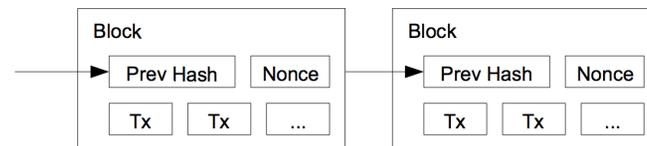

Form of randomized leader election

- Each time a nonce is found:
 - New leader elected for past epoch (~10 min)
 - Leader elected randomly, probability of selection proportional to leader’s % of global hashing power
 - Leader decides which transactions comprise block

23

23

One block = many transactions

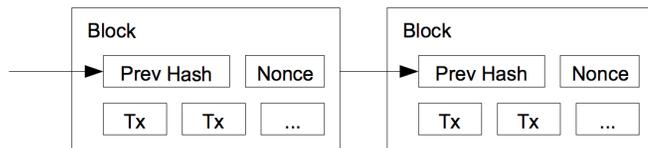

- Each miner picks a set of transactions for block
- Builds “block header”: prevhash, version, timestamp, txns, ...
- Until hash < target OR another node wins:
 - Pick nonce for header, compute hash = SHA256(SHA256(header))

24

24

Transactions are delayed

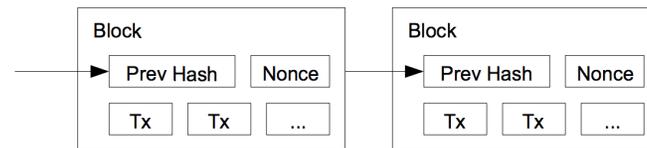

- At some time T , block header constructed
- Those transactions had been received $[T - 10 \text{ min}, T]$
- Block will be generated at time $T + 10 \text{ min}$ (on average)
- So transactions are from 10 - 20 min before block creation
- Can be much longer if “backlog” of transactions are long

25

25

Commitments further delayed

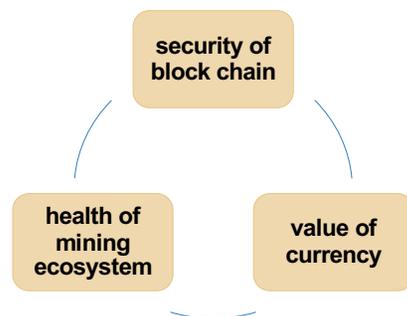

- When do you trust a transaction?
 - After we know it is “stable” on the hash chain
 - Recall that the longer the chain, the hard to “revert”
- Common practice: transaction “committed” when 6 blocks deep
 - i.e., Takes another ~1 hour for txn to become committed

26

26

Bitcoin & blockchain intrinsically linked

27

27

Summary

- Coins xfer/split between “addresses” (PK) in txns
- Blockchain: Global ordered, append-only log of txns
 - Reached through decentralized consensus
 - Each epoch, “random” node selected to batch transactions into block and append block to log
 - Nodes incentivized to perform work and act correctly
 - When “solve” block, get block rewards + txn fees
 - Only “keep” reward if block persists on main chain

28

28

Appendix

29

29

Transaction format: strawman

Create 12.5 coins, credit to Alice

Transfer 3 coins from Alice to Bob

SIGNED(Alice)

Transfer 8 coins from Bob to Carol

SIGNED(Bob)

Transfer 1 coins from Carol to Alice

SIGNED(Carol)

How do you determine if Alice has balance?
Scan backwards to time 0 !

30

30

Transaction format

Inputs:	\emptyset	// Coinbase reward
Outputs:	25.0	→PK_Alice
Inputs:	$H(\text{prevtxn}, 0)$	// 25 BTC from Alice
Outputs:	25.0	→PK_Bob SIGNED(Alice)
Inputs:	$H(\text{prevtxn}, 0)$	// 25 BTC From Alice
Outputs:	5.0	→PK_Bob, 20.0 →PK_Alice2 SIGNED(Alice)
Inputs:	$H(\text{prevtxn1}, 1), H(\text{prevtxn2}, 0)$	// 10+5 BTC
Outputs:	14.9	→PK_Bob SIGNED(Alice)

- Transaction typically has 1+ inputs, 1+ outputs
- Making change: 1st output payee, 2nd output self
- Output can appear in single later input (avoids scan back)

31

31

Transaction format

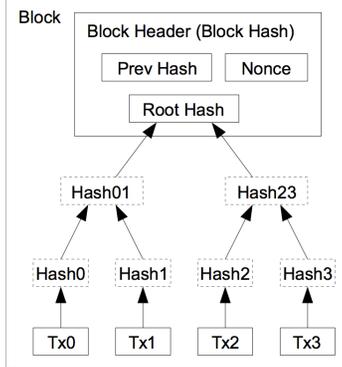

Inputs:	\emptyset	// Coinbase reward
Outputs:	25.0	→PK_Alice
Inputs:	$H(\text{prevtxn}, 0)$	// 25 BTC from Alice
Outputs:	25.0	→PK_Bob SIGNED(Alice)
Inputs:	$H(\text{prevtxn}, 0)$	// 25 BTC From Alice
Outputs:	5.0	→PK_Bob, 20.0 →PK_Alice2 SIGNED(Alice)
Inputs:	$H(\text{prevtxn1}, 1), H(\text{prevtxn2}, 0)$	// 10+5 BTC
Outputs:	14.9	→PK_Bob SIGNED(Alice)

- Unspent portion of inputs is “transaction fee” to miner
- In fact, “outputs” are stack-based scripts
- 1 Block = 1MB max

32

32

Storage / verification efficiency

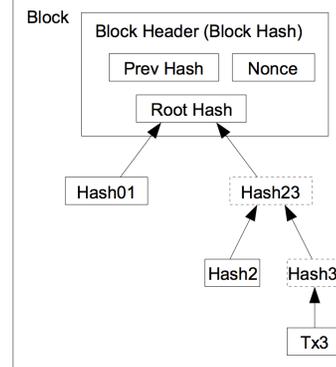

- Merkle tree
 - Binary tree of hashes
 - Root hash “binds” leaves given collision resistance
- Using a root hash
 - Block header now constant size for hashing
 - Can prune tree to reduce storage needs over time

33

33

Storage / verification efficiency

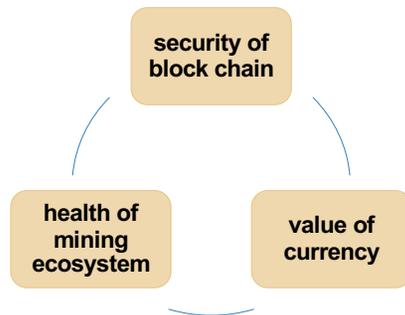

- Merkle tree
 - Binary tree of hashes
 - Root hash “binds” leaves given collision resistance
- Using a root hash
 - Block header now constant size for hashing
 - Can prune tree to reduce storage needs over time
 - Can prune when all txn outputs are spent
 - Now: 80GB pruned, 300GB unpruned

34

34

Bitcoin & blockchain intrinsically linked

35

35

Rich ecosystem: Mining pools

health of mining ecosystem

- Mining == gambling:
 - Electricity costs \$, huge payout, low probability of winning
- Development of mining pools to **amortize risk**
 - Pool computational resources, participants “paid” to mine e.g., rewards “split” as a fraction of work, etc
 - Verification? Demonstrate “easier” proofs of work to admins
 - Prevent theft? Block header (coinbase txn) given by pool

36

36

BLOCKTECH in FINANCIAL SERVICES VIRTUALscape by William Mougayar

APPLICATIONS & SOLUTIONS

- Brokerage:** Coinbase, BitStamp, Unocoin, BTCC, BITFINEX, CIRCLE, COINJA, QUANTUMEX, safele, volabit, coins.ph
- Exchanges:** BITSTAMP, POLONEX, bitcoin.de, BITCO, GEMINI, BITSO, CRAMPDEX, SWAMIUM, COINFEIN, BITUS, COINSTRAT, BTC, BITSTAMP
- Soft Wallets:** BLOCKCHAIN, airBitz, Ledger Wallet, keep key, COINBASE, XAPO, bread, MYCELIUM, COINPRISM
- Hard Wallets:** Ledger Wallet, keep key, COINBASE, XAPO, bread, MYCELIUM, COINPRISM
- Investments:** Grayscale, BITCOIN, Yuboao, KOIBANK, BITBOND, WEIFUND, BITBOND, BITBOND, BITBOND, BITBOND
- Microtransactions:** BITMESH, CHANGE TIP, PRO TIP, SHOWBOY
- Trading Platforms:** ORDERBOOK, TRADEWAVE, COINUT, ALT OPTIONS, TERIA EXCHANGE, GIMEX, MITRO, CRYEX, STOKET, TABTRADER, NOBLE, ALPHAPoint
- Capital Markets:** Chain, symbiont, NASDAQ Private Market, Digital Asset Holdings, clearmatics, itBit, TradeBlock, epidigits
- Money Services:** CRYPTO PAY, ABRA, DBITWALA, COINX, UPHOLD, RE-BIT, DUO, COINPAY, COINPARL, GLIDERA, BRIDGE21
- ATMs:** LocalBitcoins.com, Robocoin, bitxatm, bitaccess, skyhook, bitpoint, LRMSSU, GENESISCoin, Modenero Concierge
- Compliance:** COINSETTER, PROTUS, CHANALYSIS, BLACKSEER, COINLYTICS, MARKET TREE
- Payments:** GOCON, ABOUT PAYMENTS, BLADE, OXAZOJO, GemPay, cuber, safe & cash, PAYBITS, BITWAGE, NYNEXIS
- Payroll & Insurance:** PAYBITS, BITWAGE, NYNEXIS
- Trade Finance:** CHRONICLE, VAVE, PROVERANCE, thingchain
- Services:** DRYTONOMEX, CONSSENSUS, SOLIX, RUBIX, RUBIX
- Software Development:** Hydrachain, BLOCKMART, ERIS, MANIFOLD
- General APIs:** BITCO, COINBASE, BITCORE, COINBASE, BITCORE, COINBASE, BITCORE
- Special APIs:** OPEN ASSETS, BITBIND.IO, FACTOM, FACTOM
- Platforms:** Counterparty, FOUNDRY, BITCOIN, BITCOIN, BITCOIN, BITCOIN
- Smart Contracts:** SMART CONTRACTS, COINSPARK, COINSPARK
- Public:** Bitcoin, Bitcoin, Bitcoin, Bitcoin, Bitcoin, Bitcoin
- Special:** ripple, stellar
- Payment:** Payment, Payment, Payment, Payment, Payment, Payment
- Miners:** MINERS, MINERS, MINERS, MINERS, MINERS, MINERS
