<https://gobyexample.com>

# Today's Precept...

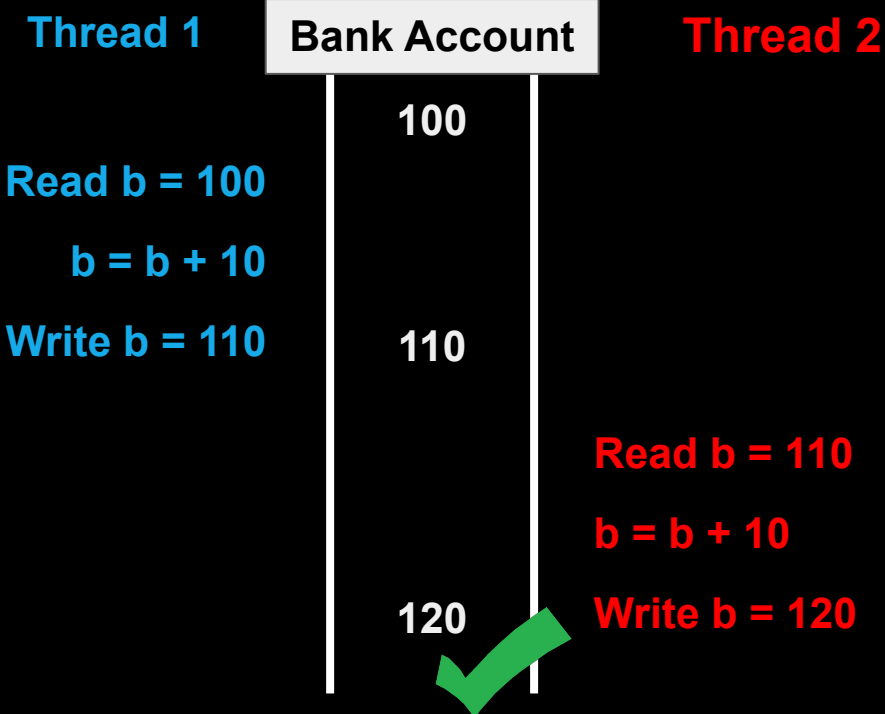

1. Two synchronization mechanisms
  - a. Locks
  - b. Channels
2. Mapreduce

# Two synchronization mechanisms

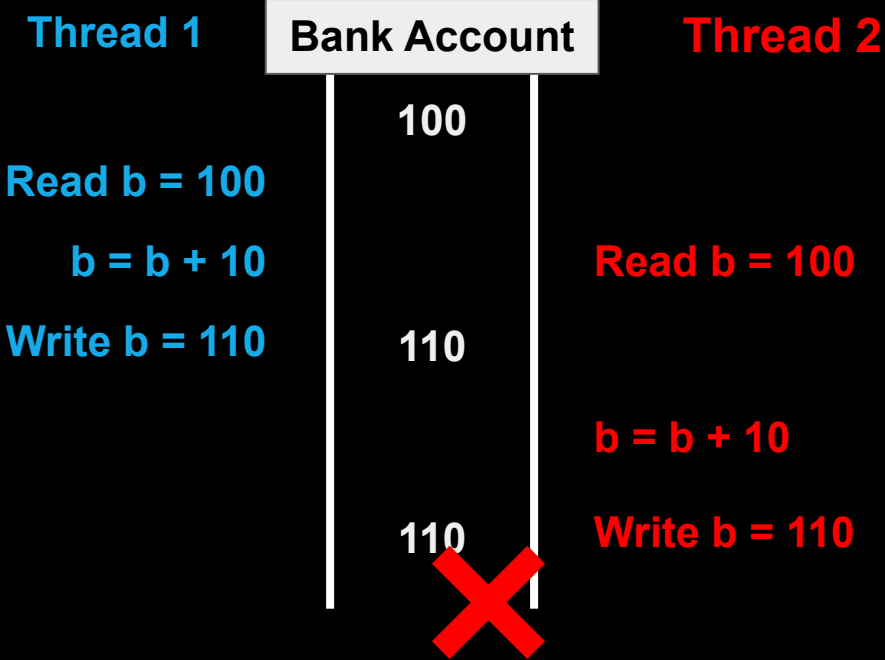

**Locks** - limit access to a critical section

**Channels** - pass information across processes using a queue

# Example: Bank account

# Example: Bank account

# What went wrong?

Changes to balance are not *atomic*

```
func Deposit(amount) {  
  
    read balance  
    balance = balance + amount  
    write balance  
  
}
```

# What went wrong?

Suppose the function is called in two threads, with the **Thread 1** chosen to run first.

## Thread 1

```
func Deposit(amount) {  
  
    read balance  
    balance = balance + amount  
    write balance  
  
}
```

## Thread 2

```
func Deposit(amount) {  
  
    read balance  
    balance = balance + amount  
    write balance  
  
}
```

# What went wrong?

Suppose the function is called in two threads, with the **Thread 1** chosen to run first.

## Thread 1

```
func Deposit(amount) {  
    read balance  
    ↓ balance = balance + amount  
    write balance  
}
```

## Thread 2

```
func Deposit(amount) {  
    read balance  
    balance = balance + amount  
    write balance  
}
```

# What went wrong?

Then, an interrupt happens, and the OS scheduler selects **Thread 2** to run.

## Thread 1

```
func Deposit(amount) {  
  read balance  
  balance = balance + amount  
  write balance  
}
```

## Thread 2

```
func Deposit(amount) {  
  read balance  
  balance = balance + amount  
  write balance  
}
```

# What went wrong?

Thread 1 did not write new balance to shared storage, so Thread 2 reads the old value.

## Thread 1

```
func Deposit(amount) {  
  read balance  
  balance = balance + amount  
  write balance  
}
```

## Thread 2

```
func Deposit(amount) {  
  read balance  
  balance = balance + amount  
  write balance  
}
```

# What went wrong?

This is called a **race condition**.

## Thread 1

```
func Deposit(amount) {  
  read balance  
  balance = balance + amount  
  write balance  
}
```

## Thread 2

```
func Deposit(amount) {  
  read balance  
  balance = balance + amount  
  write balance  
}
```

# Solution - Locks

Changes to balance are now *atomic*.

```
func Deposit(amount) {  
    lock balanceLock  
    read balance  
    balance = balance + amount  
    write balance  
    unlock balanceLock  
}
```

***Critical section***

# Locks in Go

```
package account
```

```
import "sync"
```

```
type Account struct {  
    balance int  
}
```

```
func NewAccount(init int) Account {  
    return Account{balance: init}  
}
```

```
func (a *Account) CheckBalance() int {  
  
    return a.balance  
}
```

```
func (a *Account) Withdraw(v int) {  
  
    a.balance -= v  
}
```

```
func (a *Account) Deposit(v int) {  
  
    a.balance += v  
}
```

# Locks in Go

```
package account
```

```
import "sync"
```

```
type Account struct {  
    balance int  
    mu sync.Mutex  
}
```

```
func NewAccount(init int) Account {  
    return Account{balance: init}  
}
```

```
func (a *Account) CheckBalance() int {  
    a.mu.Lock()  
    defer a.mu.Unlock()  
    return a.balance  
}
```

```
func (a *Account) Withdraw(v int) {  
    a.mu.Lock()  
    defer a.mu.Unlock()  
    a.balance -= v  
}
```

```
func (a *Account) Deposit(v int) {  
    a.mu.Lock()  
    defer a.mu.Unlock()  
    a.balance += v  
}
```

# Read Write Locks in Go

```
package account
```

```
import "sync"
```

```
type Account struct {  
    balance int  
}
```

```
func NewAccount(init int) Account {  
    return Account{balance: init}  
}
```

```
func (a *Account) CheckBalance() int {  
    a.rwLock.RLock()  
}
```

```
func (a *Account) Withdraw(v int) {  
    a.balance -= v  
}
```

```
func (a *Account) Deposit(v int) {  
    a.balance += v  
}
```

# Read Write Locks in Go

```
package account
```

```
import "sync"
```

```
type Account struct {  
    balance int  
    rwLock sync.RWMutex  
}
```

```
func NewAccount(init int) Account {  
    return Account{balance: init}  
}
```

```
func (a *Account) CheckBalance() int {  
    a.rwLock.RLock()  
    defer a.rwLock.RUnlock()  
    return a.balance  
}
```

```
func (a *Account) Withdraw(v int) {  
    a.rwLock.Lock()  
    defer a.rwLock.Unlock()  
    a.balance -= v  
}
```

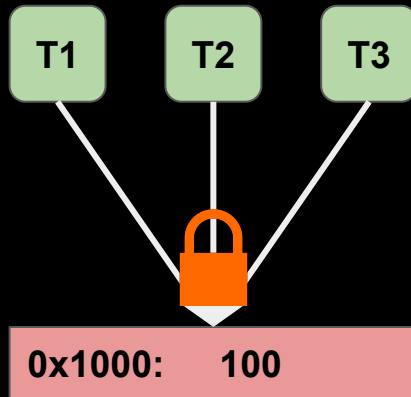

```
func (a *Account) Deposit(v int) {  
    a.rwLock.Lock()  
    defer a.rwLock.Unlock()  
    a.balance += v  
}
```

# Two Solutions to the Same Problem

## Locks:

Multiple threads can reference same memory location

Use lock to ensure only one thread is updating it at any given time

## Channels:

Data item initially stored in channel

Threads must request item from channel, make updates, and return item to channel

# Bank Account Code (using channels)

```
package account

type Account struct {
    // Fill in Here
}

func NewAccount(init int) Account {
    // Fill in Here
}

func (a *Account) CheckBalance() int {
    // What goes Here?
}

func (a *Account) Withdraw(v int) {
    // ???
}

func (a *Account) Deposit(v int) {
    // ???
}
```

# Bank Account Code (using channels)

```
package account

type Account struct {
    balance chan int
}

func NewAccount(init int) Account {
    a := Account{
        balance: make(chan int, 1)
    }
    a.balance <- init
    return a
}

func (a *Account) CheckBalance() int {
    // What goes Here?
}

func (a *Account) Withdraw(v int) {
    // ???
}

func (a *Account) Deposit(v int) {
    // ???
}
```

# Bank Account Code (using channels)

```
package account
```

```
type Account struct {  
    balance chan int  
}
```

```
func NewAccount(init int) Account {  
    a := Account{  
        balance: make(chan int, 1)  
    }  
    a.balance <- init  
    return a  
}
```

```
func (a *Account) CheckBalance() int {  
    bal := <-a.balance  
    a.balance <- bal  
    return bal  
}
```

```
func (a *Account) Withdraw(v int) {  
    // ???  
}
```

```
func (a *Account) Deposit(v int) {  
    //???  
}
```

# Bank Account Code (using channels)

```
package account
```

```
type Account struct {  
    balance chan int  
}
```

```
func NewAccount(init int) Account {  
    a := Account{  
        balance: make(chan int, 1)  
    }  
    a.balance <- init  
    return a  
}
```

```
func (a *Account) CheckBalance() int {  
    bal := <-a.balance  
    a.balance <- bal  
    return bal  
}
```

```
func (a *Account) Withdraw(v int) {  
    bal := <-a.balance  
    a.balance <- (bal - v)  
}
```

```
func (a *Account) Deposit(v int) {  
    //???
```

# Bank Account Code (using channels)

```
package account
```

```
type Account struct {  
    balance chan int  
}
```

```
func NewAccount(init int) Account {  
    a := Account{  
        balance: make(chan int, 1)  
    }  
    a.balance <- init  
    return a  
}
```

```
func (a *Account) CheckBalance() int {  
    bal := <-a.balance  
    a.balance <- bal  
    return bal  
}
```

```
func (a *Account) Withdraw(v int) {  
    bal := <-a.balance  
    a.balance <- (bal - v)  
}
```

```
func (a *Account) Deposit(v int) {  
    bal := <-a.balance  
    a.balance <- (bal + v)  
}
```

# Go channels

**Channels** also allow us to safely communicate between **goroutines**

```
result := make(chan int, numWorkers)

// Launch workers
for i := 0; i < numWorkers; i++ {
    go func() {
        doWork()
        result <- i
    }()
}

// Wait until all worker threads have finished
for i := 0; i < numWorkers; i++ {
    handleResult(<-result)
}

fmt.Println("Done!")
```

# Go channels

Easy to express  
asynchronous RPC

Awkward to express  
this using locks

```
result := make(chan int, numServers)

// Send query to all servers
for i := 0; i < numServers; i++ {
    go func() {
        resp := // ... send RPC to server
        result <- resp
    }()
}

// Return as soon as the first server responds
handleResponse(<-result)
```

# Select statement

`select` allows a goroutine to wait on multiple channels at once

```
for {
    select {
        case money := <-dad:
            buySnacks(money)
        case money := <-mom:
            buySnacks(money)
    }
}
```

# Select statement

`select` allows a goroutine to wait on multiple channels at once

```
for {
    select {
        case money := <-dad:
            buySnacks(money)
        case money := <-mom:
            buySnacks(money)
        case default:
            starve()
            time.Sleep(5 * time.Second)
    }
}
```

# Handle timeouts using select

```
// Asynchronously request an answer
// from server, timing out after X
// seconds
result := make(chan int)
timeout := make(chan bool)

// Ask server
go func() {
    response := // ... send RPC
    result <- response
}()

// Start timer
go func() {
    time.Sleep(5 * time.Second)
    timeout <- true
}()

// Wait on both channels
select {
    case res := <-result:
        handleResult(res)
    case <-timeout:
        fmt.Println("Timeout!")
}
```

# Exercise: Implementing a mutex using channels

```
type Lock struct {  
    // ???  
}  
  
func NewLock() Lock {  
    // ???  
}  
  
func (l *Lock) Lock() {  
    // ???  
}  
  
func (l *Lock) Unlock() {  
    // ???  
}
```

# Exercise: Implementing a mutex using channels

```
type Lock struct {
    ch chan bool
}

func NewLock() Lock {
    // ???
}

func (l *Lock) Lock() {
    // ???
}

func (l *Lock) Unlock() {
    // ???
}
```

# Exercise: Implementing a mutex using channels

```
type Lock struct {  
    ch chan bool  
}  
  
func NewLock() Lock {  
    lock := Lock{make(chan bool, 1)}  
    lock.ch <- true  
    return lock  
}  
  
func (l *Lock) Lock() {  
    // ???  
}  
  
func (l *Lock) Unlock() {  
    // ???  
}
```

# Exercise: Implementing a mutex using channels

```
type Lock struct {
    ch chan bool
}

func NewLock() Lock {
    lock := Lock{make(chan bool, 1)}
    lock.ch <- true
    return lock
}

func (l *Lock) Lock() {
    <-lock.ch
}

func (l *Lock) Unlock() {
    // ???
}
```

# Exercise: Implementing a mutex using channels

```
type Lock struct {
    ch chan bool
}

func NewLock() Lock {
    lock := Lock{make(chan bool, 1)}
    lock.ch <- true
    return lock
}

func (l *Lock) Lock() {
    <-lock.ch
}

func (l *Lock) Unlock() {
    lock.ch <- true
}
```

# Mutexes vs. Semaphores

**Mutexes** allow 1 process to enter critical section at a time. Allows at most  $n$  concurrent accesses

**Semaphores** allow up to  $N$  processes to enter critical section simultaneously

# Outline

Two synchronization mechanisms

Locks

Channels

**Mapreduce**

## Application: Word count

*How much wood would a woodchuck chuck  
if a woodchuck could chuck wood?*

*how: 1, much: 1, wood: 2, would: 1, a: 2, woodchuck: 2,  
chuck: 2, if: 1, could: 1*

# Application: Word count

**Locally:** tokenize and put words in a hash map

**How do you parallelize this?**

**Partition** the document into  $n$  partitions.

Build  $n$  hash maps, one for each partition

Merge the  $n$  hash maps (by key)

***How do you do this in a distributed environment?***

When in the Course of human events, it becomes necessary for one people to dissolve the political bands which have connected them with another, and to assume, among the Powers of the earth, the separate and equal station to which the Laws of Nature and of Nature's God entitle them, a decent respect to the opinions of mankind requires that they should declare the causes which impel them to the separation.

## **Input document**

When in the Course of human events, it becomes necessary for one people to

---

dissolve the political bands which have connected them with another, and to assume,

---

among the Powers of the earth, the separate and equal station to which the Laws of

---

Nature and of Nature's God entitle them, a decent respect to the opinions of mankind

---

requires that they should declare the causes which impel them to the separation.

## Partition

earth: 1, separate: 1,  
equal: 1, and: 1 ...

**Compute word counts locally**

# Merging results computed locally

## Several options

Don't merge — requires additional computation for correct results

Send everything to one node — what if data is too big? Too slow...

Partition key space among nodes in cluster (e.g. [a-e], [f-j], [k-p] ...)

1. Assign a key space to each node
2. Split local results by the key spaces
3. Fetch and merge results that correspond to the node's key space

requires: 1, that: 1,  
they: 1, should: 1,  
declare: 1, the: 1,  
causes: 1, which: 1 ...

nature: 2, of: 2,  
mankind: 1, of: 1,  
opinion: 1, political: 1

**Note the duplicates...**

## Merge results received from other nodes

# Mapreduce

Partition dataset into many chunks

**Map stage:** Each node processes one or more chunks locally

**Reduce stage:** Each node fetches and merges partial results from all other nodes

# Mapreduce Interface

**map(key, value) -> list(<k', v'>)**

Apply function to (key, value) pair

Outputs list of intermediate pairs

**reduce(key, list<value>) -> <k', v'>**

Applies aggregation function to values

Outputs result

# Mapreduce: Word count

**map(key, value) :**

```
// key = document name
// value = document contents
for each word w in value:
    emit (w, 1)
```

**reduce(key, values) :**

```
// key = the word
// values = number of occurrences of that word
count = sum(values)
emit (key, count)
```

# Mapreduce: Word count

# Why is implementing MapReduce hard?

- Failure is common
    - Even if each machine is available  $p = 99.999\%$  of the time, a datacenter with  $n = 100,000$  machines still encounters failures  $(1-p^n) = 63\%$  of the time
  - Data skew causes unbalanced performance across cluster
- Problems occur at scale.
- Hard to debug!
