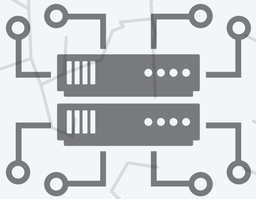
- *stacks and queues*
- *linked lists*
- *symbol tables*
- *Java collections framework*



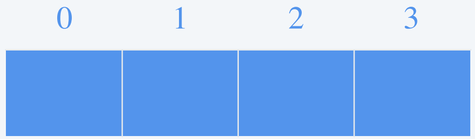
Last updated on 4/1/25 7:13PM

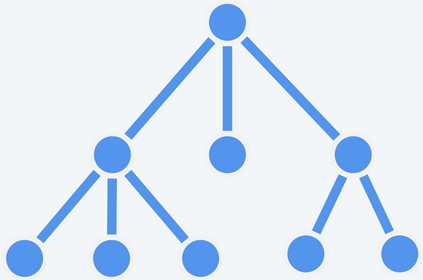
Data structures

Data structure. Method for organizing data in a computer so that it can be accessed efficiently.

category	data structures
array	1D array, resizing array, binary heap, Bloom filter, ring buffer, …
linked list	singly linked list, doubly linked list, blockchain, …
tree	binary search tree, k-d tree, Merkle tree, B-tree, decision tree, …
composite	2D array, hash table, tensor, sparse matrix, graph, …

Guitar Hero

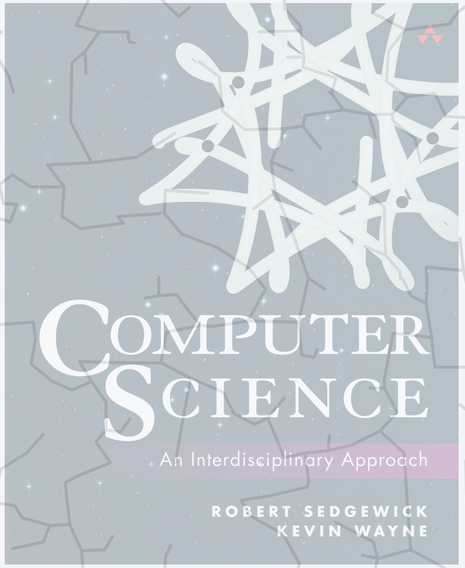




Collections

A collection is a data type that stores a group of related items.

collection	core operations	data structure
stack	PUSH, POP	singly linked list resizing array
queue	ENQUEUE, DEQUEUE	
symbol table	PUT, GET, DELETE	binary search tree hash table
set	ADD, CONTAINS, DELETE	
⋮	⋮	⋮



https://introcs.cs.princeton.edu

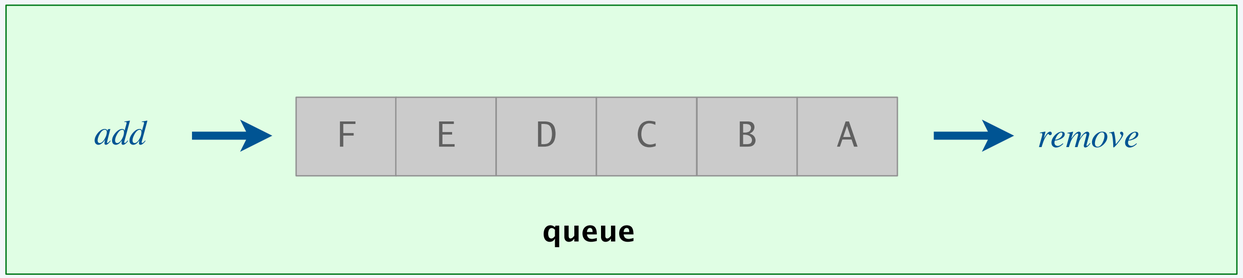
4.3 Data Structures

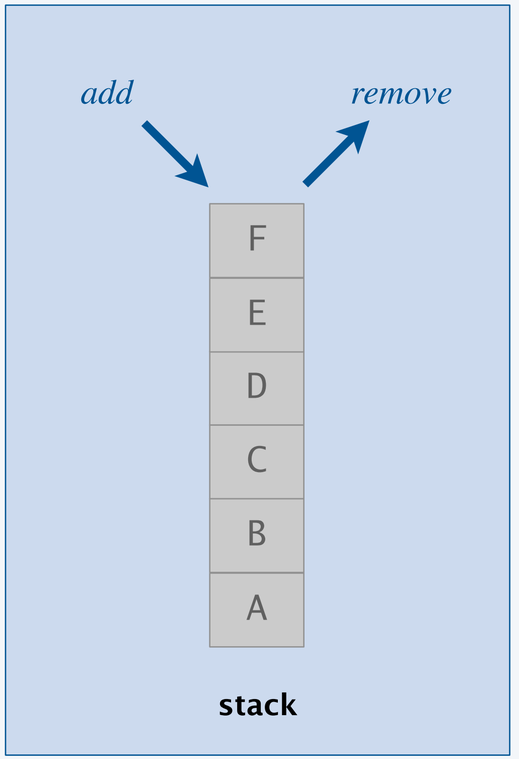
- *collections*
- *stacks and queues*
- *linked lists*
- *symbol tables*
- *Java collections framework*

Stacks and queues

Fundamental data types.

- Value: collection of objects.
- Operations: add, remove, iterate, size, test if empty.
- Intent is clear when we add.
- Which item do we remove?





Stack. Remove the item most recently added. ⟵ *LIFO = "last in first out"*

Queue. Remove the item least recently added. ⟵ *FIFO = "first in first out"*

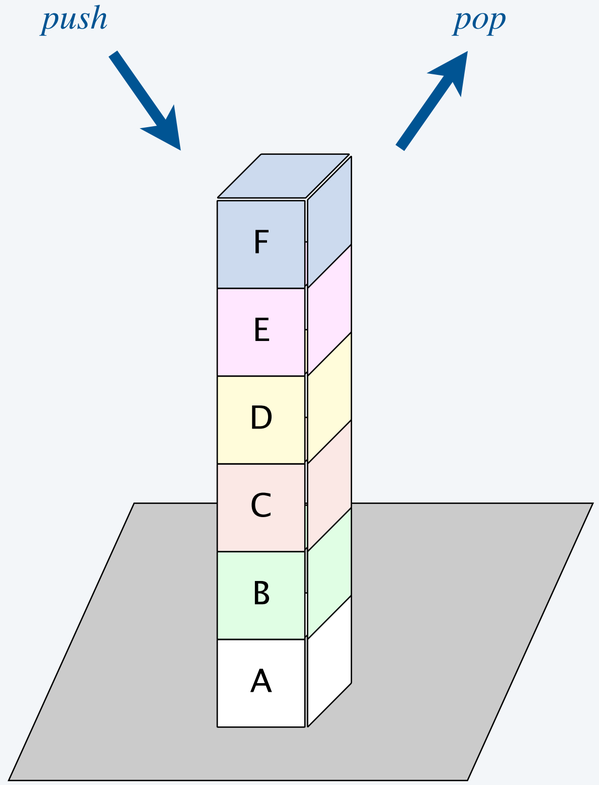
Stack API

Stack data type. Our textbook data type for stacks.

available with `javac-introcs` *and* `java-introcs` *commands*

"generic type parameter"

`public class Stack<Item>`		**description**
	`Stack()`	*create an empty stack*
`void`	`push(Item item)`	*add a new item to the stack*
`Item`	`pop()`	*remove and return the item most recently added*
`boolean`	`isEmpty()`	*is the stack empty?*
`int`	`size()`	*number of items on the stack*



Performance requirements. Every operation takes constant time.

Stack warmup client

Goal. Read strings from standard input and print in reverse order.

- Read strings from standard input and push onto stack.
- Pop all strings from stack and print.

"type argument" (can be any reference type)

```
public class Reverse {
   public static void main(String[] args) {
      Stack<String> stack = new Stack<String>();

      while (!StdIn.isEmpty()) {
         String s = StdIn.readString();
         stack.push(s);
      }

      while (!stack.isEmpty()) {
         String s = stack.pop();
         StdOut.print(s + " ");
      }
      StdOut.println();
   }
}
```

create stack

push strings onto stack

pop strings from stack and print

```
~/cos126/ds> java-introcs Reverse
I have a dream today
<Ctrl-D>
today dream a have I
```

Data structures: quiz 1

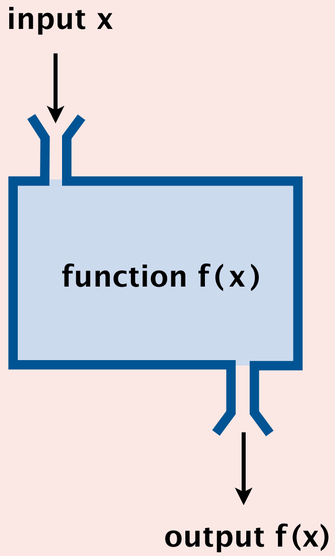
Which would not be implemented with a stack?

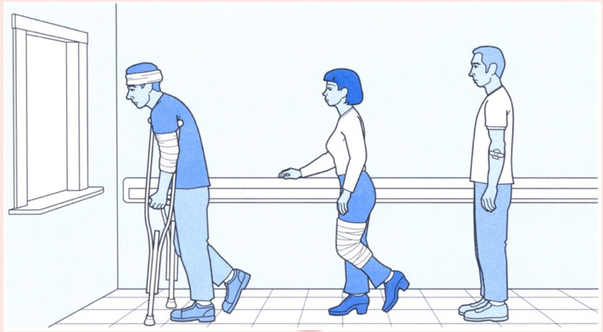
A. Back button in a browser.

B. Undo in a word processor.

C. Function-call stack.

D. Triage in a hospital.





Arithmetic expression evaluation

Goal. Write a program to evaluate infix expressions.

```
( 1 + ( ( 2 + 3 ) * ( 4 * 5 ) ) )
```

for simplicity, fully parenthesized and tokens separated by whitespace

operand (value)

operator

Solution. Dijkstra's two-stack algorithm. [see demo]

Context. An interpreter!

a program that executes instructions (e.g., infix expressions) without compiling to machine language

Dijkstra's two-stack algorithm demo

Value: push onto the value stack.

Operator: push onto the operator stack.

Left parenthesis: ignore.

Right parenthesis: pop operator and two values; push the result onto the value stack.

of applying that operator to those two values

value stack operator stack

infix expression (fully parenthesized)

(	1	+	(	(	2	+	3	)	*	(	4	*	5	)	)	)

operand (value) *operator* *parenthesis*

Arithmetic expression evaluation: correctness

Q. Why correct?

A. When algorithm encounters an operator surrounded by two values within parentheses,
it leaves the result on the value stack.

```
( 1 + ( ( 2 + 3 ) * ( 4 * 5 ) ) )
```

as if the original input were:

```
( 1 + ( 5 * ( 4 * 5 ) ) )
```

Repeating the argument:

```
( 1 + ( 5 * 20 ) )
( 1 + 100 )
101
```

Extensions. More operators, precedence order, associativity, ...

Arithmetic expression evaluation: Java implementation

```
public class Evaluate {
   public static void main(String[] args) {
      Stack<String> ops  = new Stack<String>();
      Stack<Double> vals = new Stack<Double>();

      while (!StdIn.isEmpty()) {
         String s = StdIn.readString();
         if      (s.equals("(")) /* no-op */ ;
         else if (s.equals("+")) ops.push(s);
         else if (s.equals("*")) ops.push(s);
         else if (s.equals(")")) {
            String op = ops.pop();
            if      (op.equals("+")) vals.push(vals.pop() + vals.pop());
            else if (op.equals("*")) vals.push(vals.pop() * vals.pop());
         }
         else vals.push(Double.parseDouble(s));
      }

      StdOut.println(vals.pop());
   }
}
```

for stack of primitive type, need to use "wrapper" type

careful with non-commutative operators such as - and / (Java evaluates functions left-to-right)

token is a number

result is last element of stack (assuming valid infix expression)

```
~/cos126/ds> java-introcs Evaluate
( 1 + 2 )
3.0

~/cos126/ds> java-introcs Evaluate
( 1 + ( ( 2 + 3 ) * ( 4 * 5 ) ) )
101.0
```

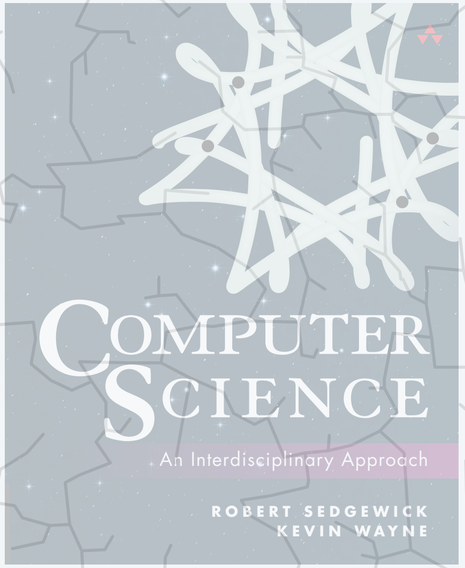
fully parenthesized and tokens separated by whitespace

Queue API

Queue data type. Our textbook data type for queues.

public class Queue<Item>		description
	Queue()	*create an empty queue*
void	enqueue(Item item)	*add a new item to the queue*
Item	dequeue()	*remove and return the item least recently added*
boolean	isEmpty()	*is the queue empty?*
int	size()	*number of items on the queue*

Performance requirements. Every operation takes constant time.



https://introcs.cs.princeton.edu

4.3 Data Structures

- *collections*
- *stacks and queues*
- *linked lists*
- *symbol tables*
- *Java collections framework*

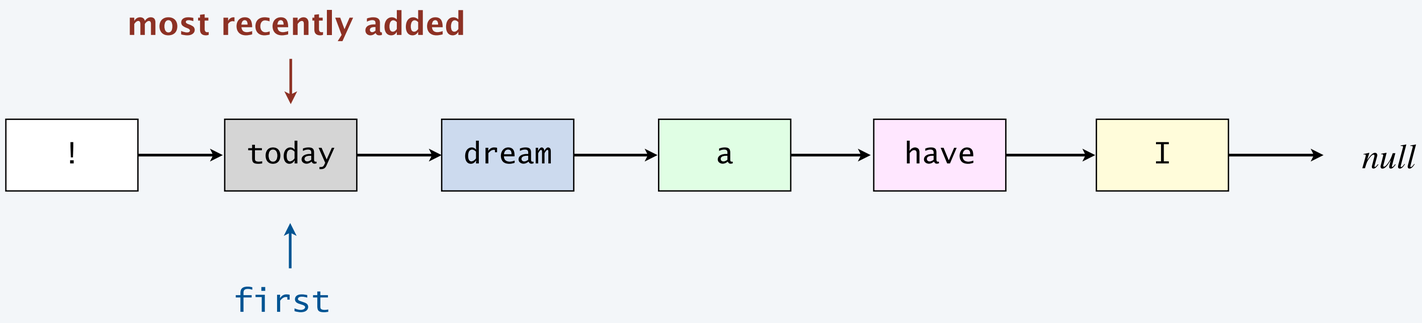
Stack implementation with a linked list

Q. How to implement a stack (or queue)?

Main challenge. Don't know how many items will be on the stack. ⟵ *otherwise, could used an array*

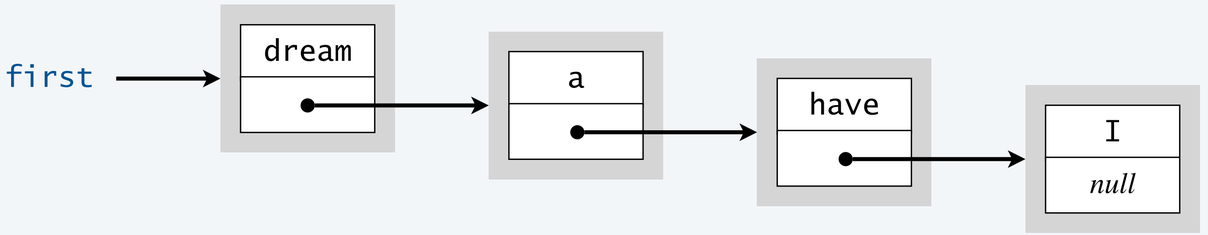
An elegant solution. Use a singly linked list.

- A node contains an item and a reference to the next node in the sequence.
- Maintain reference `first` to first node.
- Push new item before `first`.
- Pop item from `first`.



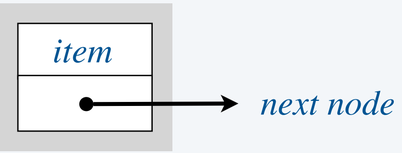
Stack implementation with a linked list: pop

singly linked list



nested class

```
private class Node {
   private String item;
   private Node next;
}
```



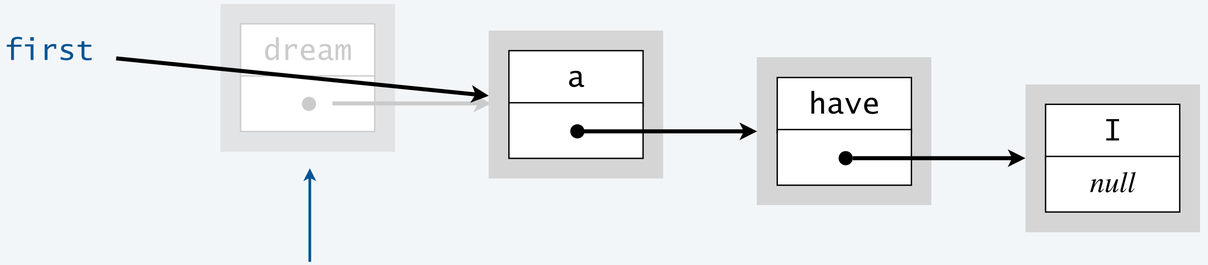
Node

save item to return

```
String item = first.item;
```

delete first node

```
first = first.next;
```



garbage collector reclaims memory when no remaining references

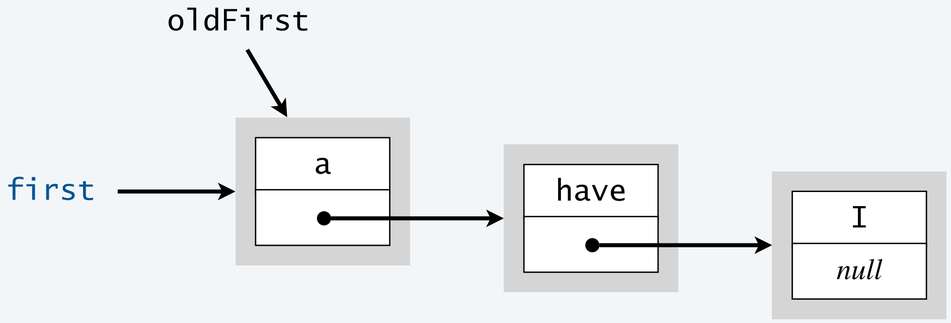
return saved item

```
return item;
```

Stack implementation with a linked list: push

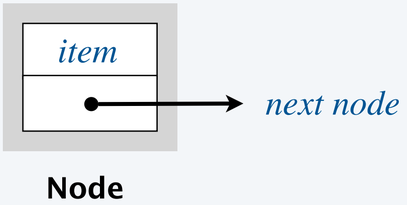
save a link to the list

```
Node oldFirst = first;
```



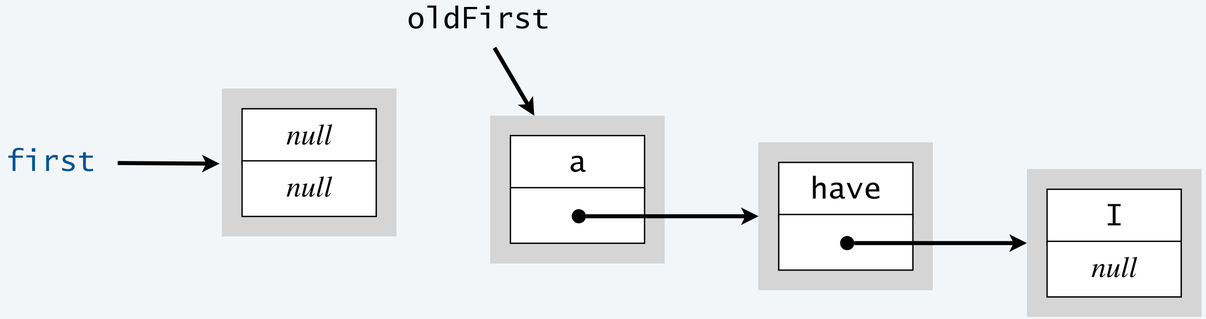
nested class

```
private class Node {
   private String item;
   private Node next;
}
```



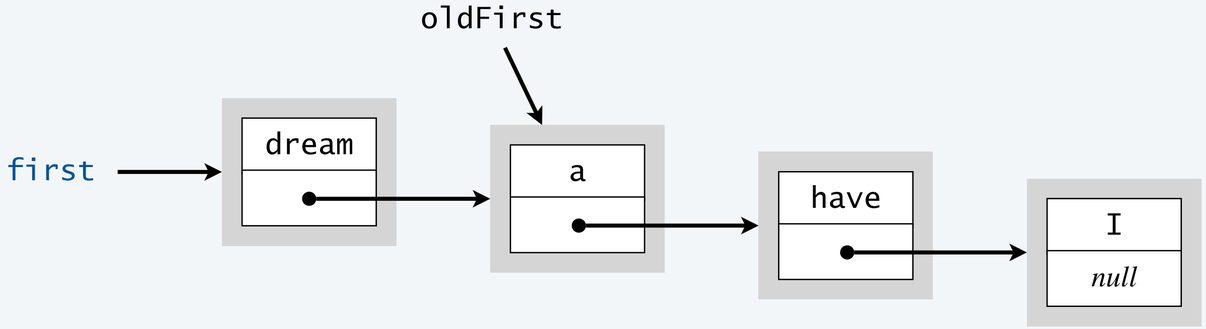
create a new node at the front

```
first = new Node();
```



initialize the instance variables in the new Node

```
first.item = "dream";
first.next = oldFirst;
```



Stack implementation with a linked list

```
public class StackOfStrings {
   private Node first;

   private class Node {
      private String item;
      private Node next;
   }

   public class Stack() {
      first = null;
   }

   public void push(String item) {
      Node oldFirst = first;
      first = new Node();
      first.item = item;
      first.next = oldFirst;
   }

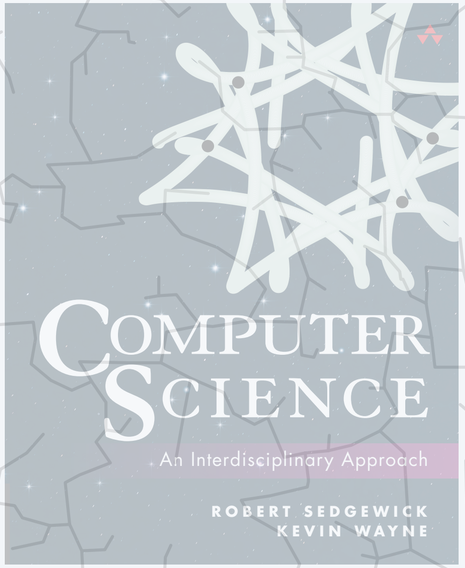
   public String pop() {
      String item = first.item;
      first = first.next;
      return item;
   }
}
```

for simplicity, we're assume items are of type String

`private` *nested class*
(*not accessible outside this file*)

no Node *constructor explicitly defined* ⇒
Java supplies default no-argument constructor

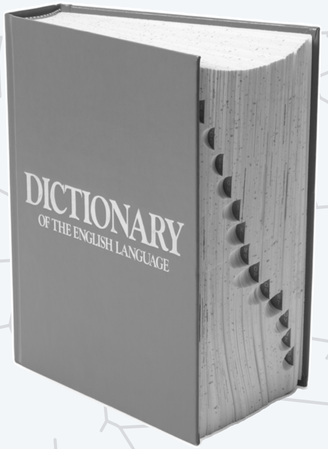
⚠ **code just beyond scope of COS 126**



https://introcs.cs.princeton.edu

4.3 Data Structures

- *collections*
- *stacks and queues*
- *linked lists*
- *symbol tables*
- *Java collections framework*



Symbol tables

Key–value pair abstraction.

- Insert a value with specified key.
- Given a key, search for the corresponding value.

also known as maps (Java), dictionaries (Python), and associative arrays (Perl)

Ex. DNS lookup.

- Insert domain name with specified IP address.
- Given domain name, find corresponding IP address.

domain name	IP address
www.cs.princeton.edu	128.112.136.61
goprincetontigers.com	67.192.28.17
wikipedia.com	208.80.153.232
google.com	172.217.11.46

key *value*

Symbol table applications

application	purpose of search	key	value
dictionary	*find definition*	word	definition
compiler	*find properties of a variable*	variable name	type and value
DNS	*find IP address*	domain name	IP address
reverse DNS	*find domain name*	IP address	domain name
file system	*find file on disk*	filename	location on disk
file share	*find song to download*	name of song	computer ID
web search	*find relevant web pages*	keyword	list of page names

Symbol table API

Symbol table data type. Our textbook data type for symbol tables.

Key *type must be comparable*
(String, Integer, Double, ...)

public class ST<Key, Value>	description	
ST()	*create an empty symbol table*	*generalizes arrays (keys need not be integers between 0 and n−1)*
void put(Key key, Value val)	*insert key–value pair*	← a[key] = val;
Value get(Key key)	*value paired with* key	← a[key]
boolean contains(Key key)	*is there a value paired with* key*?*	
Iterable<Key> keys()	*all the keys in the symbol table*	
boolean isEmpty()	*is the symbol table empty?*	
int size()	*number of key–value pairs*	
⋮		

Performance requirements. put(), get(), remove(), and contains() take logarithmic time.

Data structures: quiz 2

What does the following code fragment print?

A. 1.0

B. 1.5

C. 2.5

D. Run-time exception.

```
ST<String, Double> st = new ST<String, Double>();
st.put("a", 1.0);
st.put("b", 1.5);
st.put("a", st.get("a") + st.get("b"));
double value = st.get("a");
StdOut.println(value);
```

Text-to-English

Goal. Convert text message with emojis (or text abbreviations) to English.

- Create symbol table that maps from emoji (or text abbreviation) to English.
- Read lines from standard input, replacing emojis (or text abbreviations) with expansions.

```
~/Desktop/ds> more emojis.tsv

```

Text-to-English converter: build symbol table

```
public class TextToEnglish {
   public static void main(String[] args) {

      // build symbol table that maps from abbreviation to expansion
      ST<String, String> st = new ST<String, String>();
      In in = new In(args[0]);
      while (in.hasNextLine()) {
         String line = StdIn.readLine();
         String[] fields = line.split("\\t");
         String abbreviation = fields[0];
         String expansion = fields[1];
         st.put(abbreviation, expansion);
      }

      ...

   }
}
```

create symbol table with string keys (abbreviations) and string values (expansions)

split line into fields (using tab as delimiter)

Text-to-English converter: process lines of text

```
public class TextToEnglish {
   public static void main(String[] args) {

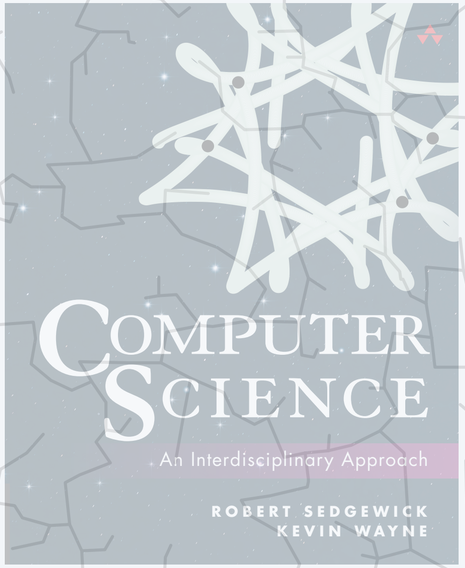
      ...

      // process lines of text, replacing abbreviations with expansions
      while (StdIn.hasNextLine()) {
         String line = StdIn.readLine();
         String[] words = line.split(" ");
         for (int i = 0; i < words.length; i++) {
            StdOut.print(words[i] + " ");
            if (st.contains(words[i])) {
               StdOut.print("[" + st.get(words[i]) + "]" + " ");
            }
         }
         StdOut.println();
      }

   }
}
```

split line into words

print expansion if word is in symbol table (delimiting with square braces)



https://introcs.cs.princeton.edu

4.3 Data Structures

- *collections*
- *stacks and queues*
- *linked lists*
- *symbol tables*
- *Java collections framework*

System libraries

Textbook libraries. Collections for stacks, queues, symbol tables, sets, ...

Java collections framework. Collections for lists, symbol tables (maps), sets, ...

collection	core operations	introcs.jar	java.util
stack	PUSH, POP	Stack	~~java.util.Stack~~
queue	ENQUEUE, DEQUEUE	Queue	java.util.LinkedList ← *provides superset of stack/queue operations* java.util.ArrayList
symbol table	PUT, GET, DELETE	ST	java.util.TreeMap java.util.HashMap
set	ADD, CONTAINS, DELETE	SET	java.util.TreeSet java.util.HashSet
⋮	⋮	⋮	

Java collections framework: lists

`java.util.LinkedList`. Java collections framework data type for lists.

`public class LinkedList<Item>`		description	running time (worst case)
	`LinkedList()`	*create an empty list*	$\Theta(1)$
`void`	`addFirst(Item item)`	*add a new item to the beginning of list*	$\Theta(1)$
`void`	`addLast(Item item)`	*add a new item to the end of list*	$\Theta(1)$
`Item`	`removeFirst()`	*remove and return item at beginning of list*	$\Theta(1)$
`Item`	`removeLast()`	*remove and return item at end of list*	$\Theta(1)$
`boolean`	`isEmpty()`	*is the list empty?*	$\Theta(1)$
`int`	`size()`	*number of items in the list*	$\Theta(1)$
`Item`	`get(int index)`	*return item at specified position in list*	$\Theta(n)$
	⋮		

← *generalizes stacks and queues*

Performance requirements. "Core" operations take constant time. ← *but many other* `LinkedList` *operations do not* (!)

Java collections framework: symbol tables

`java.util.TreeMap`. Java collections framework data type for symbol tables (maps).

public class TreeMap<Key, Value>	description	running time (worst case)
TreeMap()	*create an empty symbol table*	$\Theta(1)$
Value put(Key key, Value val)	*insert key–value pair*	$\Theta(\log n)$
Value get(Key key)	*value paired with key*	$\Theta(\log n)$
boolean containsKey(Key key)	*is there a value paired with key?*	$\Theta(\log n)$
void remove(Key key)	*remove key (and associated value)*	$\Theta(\log n)$
Set<Key> keySet()	*all the keys in the symbol table*	$\Theta(n)$
boolean isEmpty()	*is the symbol table empty?*	$\Theta(1)$
int size()	*number of key–value pairs*	$\Theta(1)$
⋮		

← *similar to API for* ST

Performance requirements. "Core" operations take logarithmic time.

Enhanced for loop (foreach loop)

Enhanced for loop. A second form of `for` loop designed to iterate over collections (and arrays).

```
LinkedList<String> list = new LinkedList<String>();
list.addLast("I");
list.addLast("have");
list.addLast("a");
list.addLast("dream");

for (String s : list) {
   StdOut.println(s);
}
```

iterates over list elements in list order

enhanced for loop with a java.util.LinkedList

```
TreeMap<String, Double> map = new TreeMap<String, Double>();
map.put("Hydrogen", 1.01);
map.put("Helium",   4.00);
map.put("Lithium",  6.94);
...

for (String s : map.keySet()) {
   StdOut.println(s + " " + map.get(s));
}
```

iterates over symbol table keys in sorted order

enhanced for loop with a java.util.TreeMap

```
double[] values = { 0.0, 2.0, 3.0, 6.125, 4.5 };
double sum = 0.0;
for (double x : values) {
   sum += x;
}
```

iterates over array elements in array order

enhanced for loop with an array

Concordance

A concordance is a list of every occurrence of each word in a text, along with surrounding context.

indices where query word appears →

```
~/Desktop/ds> java-introcs Concordance alice.txt 5   ← context window radius
hole                                                 ← query word
   12:     chapter i down the rabbit hole alice was beginning to get
  266:       pop down a large rabbit hole under the hedge in another
  293:      get out again the rabbit hole went straight on like a
 1267:        much larger than a rat hole she knelt down and looked
 6809:  hadn't gone down that rabbit hole and yet and yet it's
                          context window

flamingo
17067:     first was in managing her flamingo she succeeded in getting its
17458:       then alice put down her flamingo and began an account of
17931:  only difficulty was that her flamingo was gone across to the
17967:       time she had caught the flamingo and brought it back the
18768:      about the temper of your flamingo shall i try the experiment

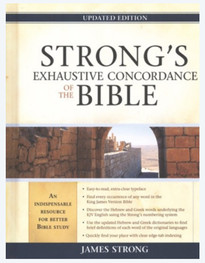
 3567:           must be a walrus or hippopotamus but then she remembered how
```

Concordance

A concordance is a list of every occurrence of each word in a text, along with surrounding context.

Pre-computational age. Compiled only for works of special importance:

- Vedas.
- Bible.
- Qur'an.
- Works of Shakespeare.
- ...



Computational age. Any COS 126 student can create one!

Spotlight search (iOS or OS X). Essentially a concordance of files on your phone/computer.

Google search. Essentially a concordance of the web.

with clever algorithm to rank results

Concordance implementation: build concordance

```
import java.util.LinkedList;
import java.util.TreeMap;

public class Concordance {
  public static void main(String[] args) {
     In in = new In(args[0]);
     String[] words = in.readAllStrings();

     // build concordance
     TreeMap<String, LinkedList<Integer>> map = new TreeMap<String, LinkedList<Integer>>();
     for (int i = 0; i < words.length; i++) {
        String s = words[i];

        if (!map.containsKey(s)) {
           map.put(s, new LinkedList<Integer>());
        }

        LinkedList<Integer> list = map.get(s);
        list.addLast(i);
     }

     ⋮
```

access Java collections libraries

read all words in file

first occurrence of word

get list associated with word

add index of word to list

Concordance implementation: process queries

```
public class Concordance {
   public static void main(String[] args) {
            ⋮

      int context = Integer.parseInt(args[1]);

      // process queries
      while (!StdIn.isEmpty()) {
         String query = StdIn.readString();
         if (map.containsKey(query)) {
            LinkedList<Integer> list = map.get(query);
            for (int k : list) {
               int start = Math.max(k - context, 0);
               int end   = Math.min(k + context, words.length - 1);
               for (int i = start; i <= end; i++) {
                  StdOut.print(words[i] + " ");
               }
               StdOut.println();
            }
         }
      }

   }
}
```

context window radius

list of indices where word appears

print 5 words before and after (context window)

Collections summary

Fundamental data types.

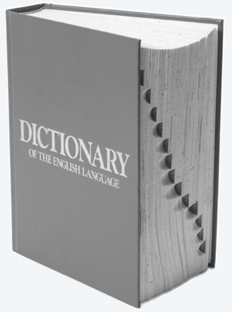
- Value: collection of objects.
- Operations: add, remove, iterate, size, …

Stack. Remove the item most recently added.

Queue. Remove the item least recently added.

Symbol table. Associate key–value pairs.

…



COS 126. Use pre-existing collection data types.

COS 226. Implement your own collections using linked data structures and resizing arrays.
