COS 217: Introduction to Programming Systems
Pointer-Related Operators

Key

```
p, p1, p2    Pointer variables
i            An integral expression
```

Operators Meaningful for Any Pointer Variable

Dereference Operator

```
*p           The contents of the memory referenced by p.
```

Equality and Inequality Relational Operators

```
p1 == p2     1 if p1 is equal to p2, and 0 otherwise.
p1 != p2     1 if p1 is unequal to p2, and 0 otherwise.
```

Assignment Operator

```
p1 = p2          Side effect:  Assign p2 to p1.  The new value of p1.
```

Operators Meaningful for Pointers that Reference Array Elements

Arithmetic Operators

```
p + i        The address of the ith element after the one referenced by p.
i + p        The address of the ith element after the one referenced by p.
p - i        The address of the ith element before the one referenced by p.
p++          Side effect:  Increment p to point to the next element.
             The previous value of p.
++p          Side effect:  Increment p to point to the next element.
             The new value of p.
p--          Side effect:  Decrement p to point to the previous element.
             The previous value of p.
--p          Side effect:  Decrement p to point to the previous element.
             The new value of p.
```

Arithmetic Operators

```
p1 - p2      The "span" of p1 and p2.
```

Relational Operators

```
p1 < p2      1 if p1 is less than p2, and 0 otherwise.
p1 <= p2     1 if p1 is less than or equal to p2, and 0 otherwise.
p1 > p2      1 if p1 is greater than p2, and 0 otherwise.
p1 >= p2     1 if p1 is greater than or equal to p2, and 0 otherwise.
```

Assignment Operators

```
p += i       Side effect:  Increment p so its value is the address of
             the ith element after the one referenced by p.
             The new value of p.
p -= i       Side effect:  Decrement p so its value is the address of
             the ith element before the one referenced by p.
             The new value of p.
```

Disallowed

```
p1 + p2
i – p
i += p
i -= p
p == i
```

Array Subscripting Operator

```
p[i]         *(p + i), that is, the contents of memory at the address
             that is i elements after the address referenced by p.
```
