Subtext of today's lecture (and this course)

Steps to developing a usable algorithm.

- Model the problem.
- Find an algorithm to solve it.
- Fast enough? Fits in memory?
- If not, figure out why.
- Find a way to address the problem.
- Iterate until satisfied.

The scientific method.

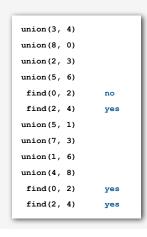

Mathematical analysis.

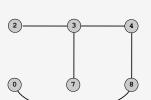

Dynamic connectivity

Given a set of objects

- Union: connect two objects.
- Find: is there a path connecting the two objects?

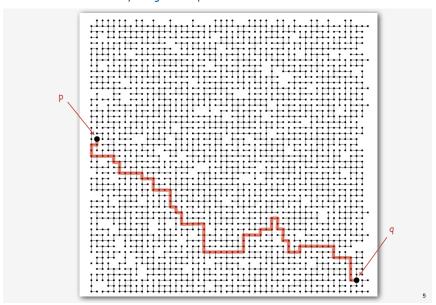

more difficult problem: find the path

→ dynamic connectivity

Network connectivity: larger example

Modeling the objects

Dynamic connectivity applications involve manipulating objects of all types.

- · Variable name aliases.
- Pixels in a digital photo.
- · Computers in a network.
- Web pages on the Internet.
- Transistors in a computer chip.
- · Metallic sites in a composite system.

When programming, convenient to name objects 0 to N-1.

- Use integers as array index.
- Suppress details not relevant to union-find.

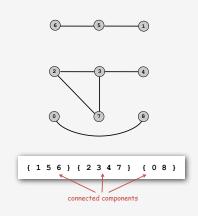

can use symbol table to translate from object names to integers (stay tuned)

Modeling the connections

Transitivity.

If p is connected to q and q is connected to r, then p is connected to r.

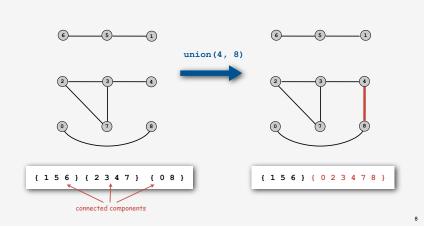

Connected components. Maximal set of objects that are mutually connected.

Implementing the operations

Find query. Check if two objects are in the same set.

Union command. Replace sets containing two objects with their union.

Union-find data type (API)

Goal. Design efficient data structure for union-find.

- Number of objects N can be huge.
- Number of operations M can be huge.
- Find queries and union commands may be intermixed.

public class UnionFind

UnionFind(int N) create union-find data structure with N objects and no connections

boolean find(int p, int q) are p and q in the same set?

void unite(int p, int q) replace sets containing p and q with their union

dynamic connectivity

▶ quick find

- > quick union
- improvements
- applications

10

Quick-find [eager approach]

Data structure.

- Integer array ia[] of size N.
- Interpretation: p and q are connected if they have the same id.

i 0 1 2 3 4 5 6 7 8 9 id[i] 0 1 9 9 9 6 6 7 8 9

5 and 6 are connected 2, 3, 4, and 9 are connected

Quick-find [eager approach]

Data structure.

- Integer array ia[] of size N.
- Interpretation: p and q are connected if they have the same id.

i 0 1 2 3 4 5 6 7 8 9 id[i] 0 1 9 9 9 6 6 7 8 9

5 and 6 are connected 2, 3, 4, and 9 are connected

Find. Check if ${\tt p}$ and ${\tt q}$ have the same id.

id[3] = 9; id[6] = 6 3 and 6 not connected

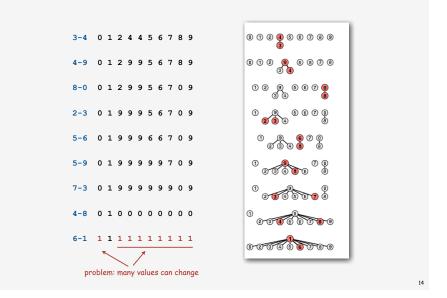

Quick-find [eager approach]

Data structure.

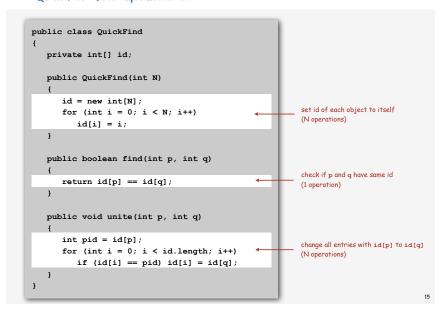

- Integer array ia[] of size N.

```
• Interpretation: p and q are connected if they have the same id.
             i 0 1 2 3 4 5 6 7 8 9
                                                            5 and 6 are connected
           id[i] 0 1 9 9 9 6 6 7 8 9
                                                          2, 3, 4, and 9 are connected
Find. Check if p and q have the same id.
                                                            id[3] = 9; id[6] = 6
                                                          3 and 6 not connected
Union. To merge sets containing p and q, change all entries with id[p] to id[q].
             i 0 1 2 3 4 5 6 7 8 9
                                                                union of 3 and 6
           id[i] 0 1 6 6 6 6 6 7 8 6
                                                          2, 3, 4, 5, 6, and 9 are connected
```

Quick-find example

Quick-find: Java implementation

problem: many values can change

Quick-find is too slow

Quick-find defect.

- Union too expensive (N operations).
- Trees are flat, but too expensive to keep them flat.

algorithm	union	find
quick-find	N	1

Ex. May take N^2 operations to process N union commands on N objects.

Quadratic algorithms do not scale

Rough standard (for now).

- 10⁹ operations per second.
- a truism (roughly) since 1950!
- 109 words of main memory.
- Touch all words in approximately 1 second.

Ex. Huge problem for quick-find.

- 109 union commands on 109 objects.
- Quick-find takes more than 10^{18} operations.
- 30+ years of computer time!

Paradoxically, quadratic algorithms get worse with newer equipment.

- New computer may be 10x as fast.
- But, has 10x as much memory so problem may be 10x bigger.
- With quadratic algorithm, takes 10x as long!

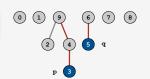

▶ quick union

Quick-union [lazy approach]

Data structure.

- Integer array ia[] of size N.
- Interpretation: id[i] is parent of i.
- Root of i is id[id[id[...id[i]...]]].

i 0 1 2 3 4 5 6 7 8 9 id[i] 0 1 9 4 9 6 6 7

3's root is 9; 5's root is 6

keep going until it doesn't change

Quick-union [lazy approach]

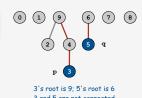

Data structure.

- Integer array ia[] of size N.
- Interpretation: id[i] is parent of i.

• Root of i is id[id[id[...id[i]...]]].

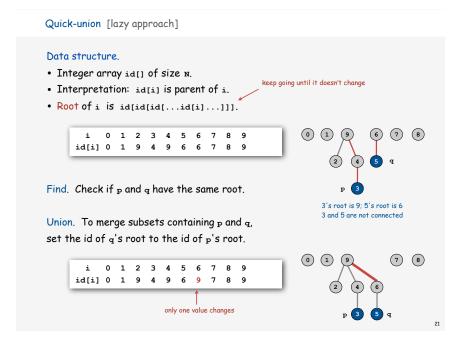

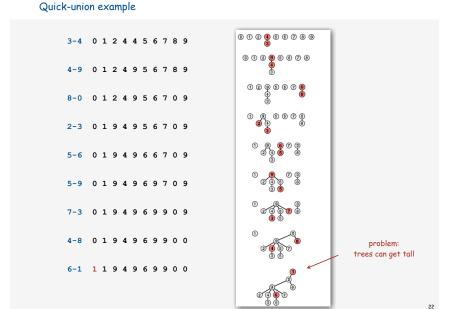

Find. Check if p and q have the same root.

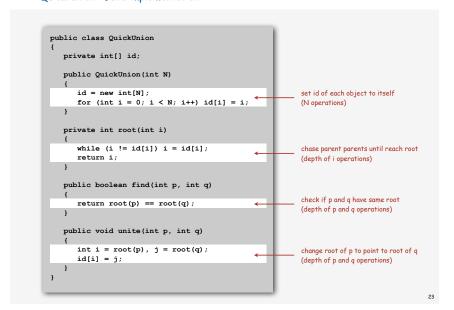

keep going until it doesn't change

3 and 5 are not connected

Quick-union: Java implementation

Quick-union is also too slow

Quick-find defect.

- Union too expensive (N operations).
- Trees are flat, but too expensive to keep them flat.

Quick-union defect.

- · Trees can get tall.
- Find too expensive (could be N operations).

algorithm	union	find		
quick-find	N	1		
quick-union	N*	N	 ←	worst case

* includes cost of finding root

dynamic connectivity quick find quick union improvements applications

Weighted quick-union. Modify quick-union to avoid tall trees. Keep track of size of each subset. Balance by linking small tree below large one. Ex. Union of 3 and 5. Quick union: link 9 to 6. Weighted quick union: link 6 to 9.

Weighted quick-union example 3-4 0 1 2 3 3 5 6 7 8 9 4-9 0 1 2 3 3 5 6 7 8 3 8-0 8 1 2 3 3 5 6 7 8 3 2-3 8 1 3 3 3 5 5 7 8 3 5-6 8 1 3 3 3 3 5 5 7 8 3 5-9 8 1 3 3 3 3 5 3 8 3 4-8 8 1 3 3 3 3 5 3 3 3 4-8 8 1 3 3 3 3 5 3 3 3 6-1 8 3 3 3 3 5 3 3 3

Weighted quick-union: Java implementation

Data structure. Same as quick-union, but maintain extra array sz[i] to count number of objects in the tree rooted at i.

Find. Identical to quick-union.

```
return root(p) == root(q);
```

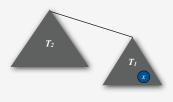

Union. Modify quick-union to:

- Merge smaller tree into larger tree.
- Update the sz[] array.

Weighted quick-union analysis

Analysis.

- Find: takes time proportional to depth of p and q.
- Union: takes constant time, given roots.
- Fact: depth is at most lq N. [needs proof]
- Q. How does depth of x increase by 1?
- A. Tree T_1 containing x is merged into another tree T_2 .
- The size of the tree containing x at least doubles since $|T_2| \ge |T_1|$.
- Size of tree containing x can double at most lg N times.

29

Weighted quick-union analysis

Analysis.

- Find: takes time proportional to depth of p and q.
- Union: takes constant time, given roots.
- Fact: depth is at most lq N. [needs proof]

algorithm	union	find
quick-find	N	1
quick-union	N *	N
weighted QU	lg N *	lg N

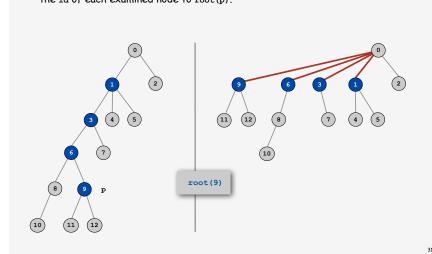

* includes cost of finding root

- Q. Stop at guaranteed acceptable performance?
- A. No, easy to improve further.

30

Improvement 2: path compression

Quick union with path compression. Just after computing the root of $_{P}$, set the id of each examined node to root $_{(P)}$.

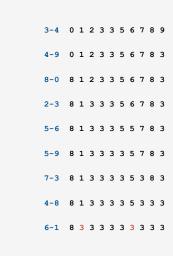

Path compression: Java implementation

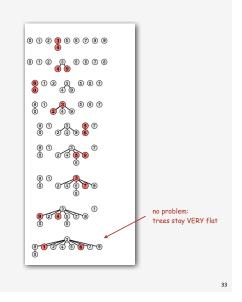

Standard implementation: add second loop to root() to set the id of each examined node to the root.

Simpler one-pass variant: halve the path length by making every other node in path point to its grandparent.

In practice. No reason not to! Keeps tree almost completely flat.

Weighted quick-union with path compression example

WQUPC performance

Theorem. [Tarjan 1975] Starting from an empty data structure, any sequence of M union and find operations on N objects takes $O(N + M \lg^* N)$ time.

- Proof is very difficult.
- But the algorithm is still simple!

actually O(N + M α(M, N))
see COS 423

Linear algorithm?

- Cost within constant factor of reading in the data.
- In theory, WQUPC is not quite linear.
- In practice, WQUPC is linear.

l because lg* N is a constant in this universe N | lg* N | 1 0 | 2 | 1 | 4 | 2 | 16 | 3 | 65536 | 4 | 265536 | 5 |

lg* function number of times needed to take the lg of a number until reaching 1

Amazing fact. No linear-time linking strategy exists.

Summary

Bottom line. WQUPC makes it possible to solve problems that could not otherwise be addressed.

algorithm	worst-case time	
quick-find	MΝ	
quick-union	ΜN	
weighted QU	N + M log N	
QU + path compression	N + M log N	
weighted QU + path compression	N + M lg* N	

M union-find operations on a set of N objects

Ex. [109 unions and finds with 109 objects]

- WQUPC reduces time from 30 years to 6 seconds.
- Supercomputer won't help much; good algorithm enables solution.

quick find
quick union
improvements
applications

Union-find applications

- Percolation.
- · Games (Go, Hex).
- √ Network connectivity.
- Least common ancestor.
- Equivalence of finite state automata.
- Hoshen-Kopelman algorithm in physics.
- Hinley-Milner polymorphic type inference.
- Kruskal's minimum spanning tree algorithm.
- Compiling equivalence statements in Fortran.
- Morphological attribute openings and closings.
- Matlab's bwlabel () function in image processing.

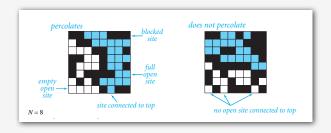

37

Percolation

A model for many physical systems:

- N-by-N grid of sites.
- Each site is open with probability p (or blocked with probability 1-p).
- System percolates if top and bottom are connected by open sites.

38

Percolation

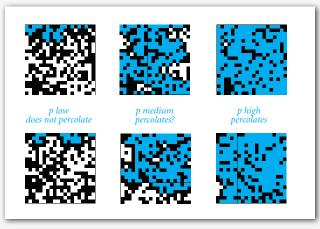

A model for many physical systems:

- N-by-N grid of sites.
- Each site is open with probability p (or blocked with probability 1-p).
- System percolates if top and bottom are connected by open sites.

model	system	vacant site	occupied site	percolates
electricity	material	conductor	insulated	conducts
fluid flow	material	empty	blocked	porous
social interaction	population	person	empty	communicates

Likelihood of percolation

Depends on site vacancy probability p.

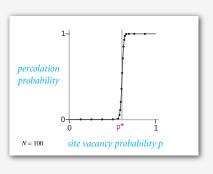

N = 20

Percolation phase transition

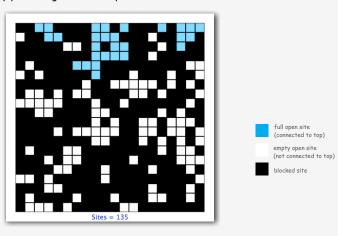

Theory guarantees a sharp threshold p* (when N is large).

- p > p*: almost certainly percolates.
- p < p*: almost certainly does not percolate.
- Q. What is the value of p*?

Monte Carlo simulation

- Initialize N-by-N whole grid to be blocked.
- Make random sites open until top connected to bottom.
- Vacancy percentage estimates p*.

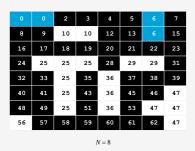

UF solution to find percolation threshold

How to check whether system percolates?

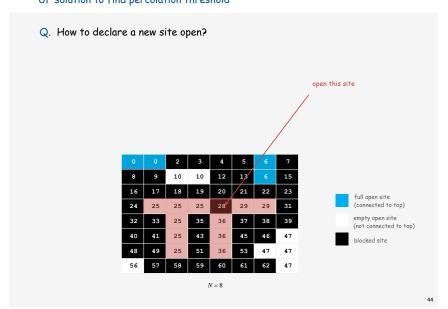

- · Create object for each site.
- Sites are in same set if connected by open sites.
- Percolates if any site in top row is in same set as any site in bottom row.

brute force alg would need to check N² pairs

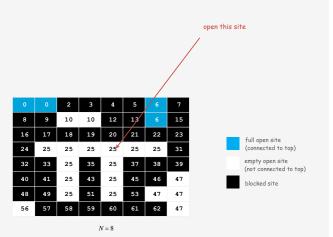

UF solution to find percolation threshold

UF solution to find percolation threshold

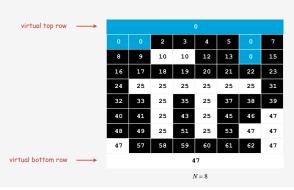

Q. How to declare a new site open?

- A. Take union of new site and all adjacent open sites.

UF solution: a critical optimization

- Q. How to avoid checking all pairs of top and bottom sites?
- A. Create a virtual top and bottom objects; system percolates when virtual top and bottom objects are in same set.

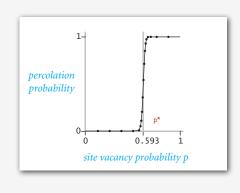

Percolation threshold

- Q. What is percolation threshold p*?
- A. About 0.592746 for large square lattices.

percolation constant known only via simulation
