

Princeton University  
 COS 217: Introduction to Programming Systems  
 IA-32 Function Calling Conventions

Low memory

When function f calls function g:

(1) If necessary, f pushes EAX, ECX, EDX, and parameters:

```
pushl %ecx
pushl param3
pushl param2
pushl param1
```

(2) f executes call instruction:  
`call g`

(3) g pushes f's EBP:  
`pushl %ebp`

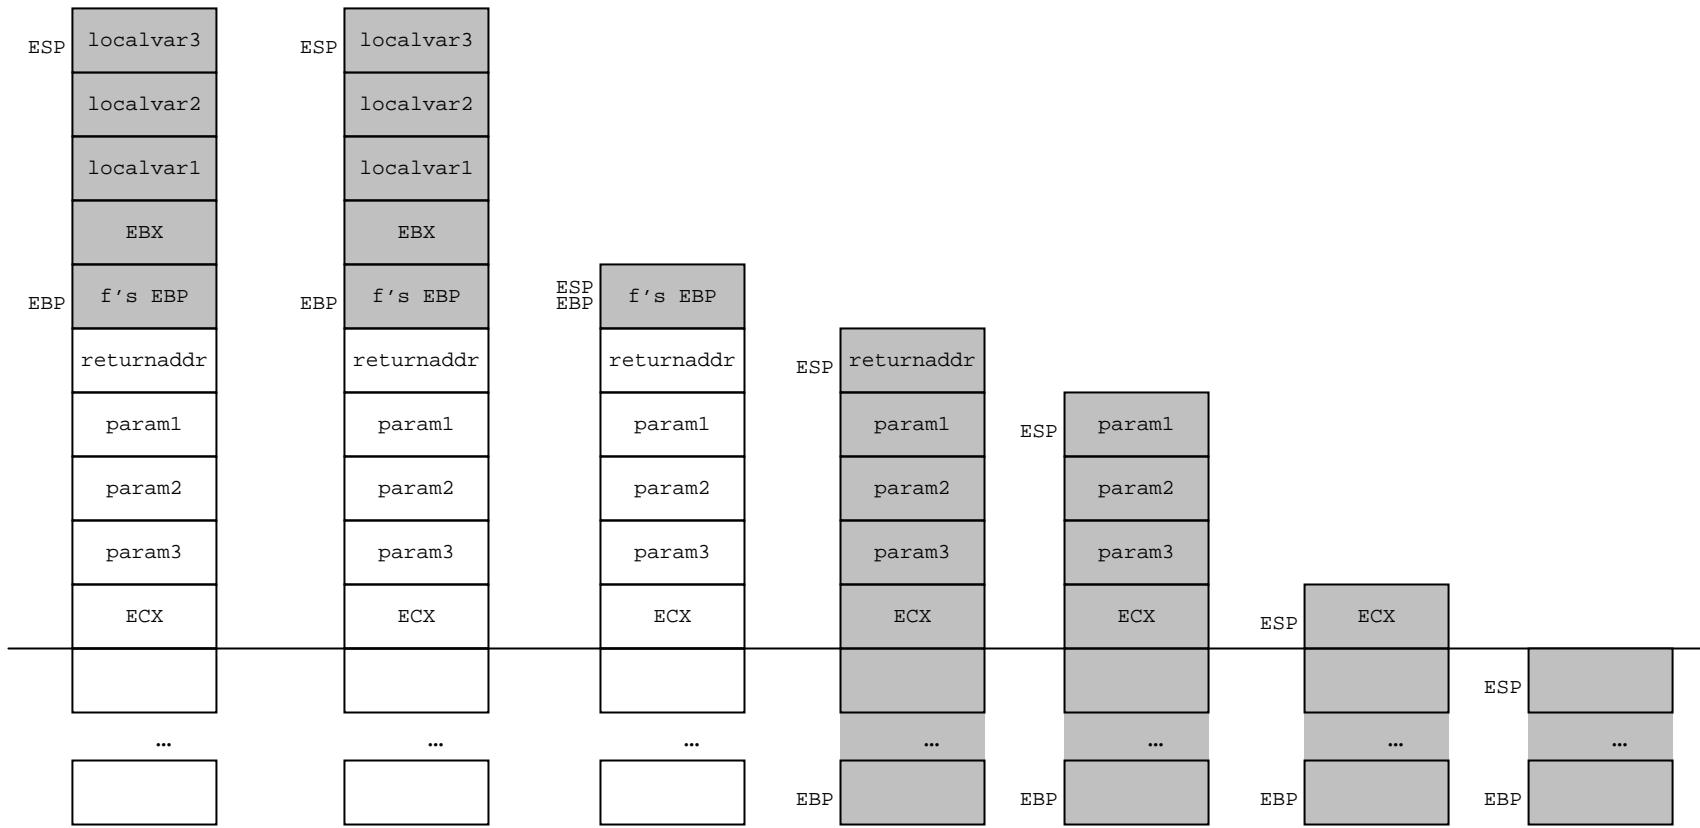

(4) g copies ESP to EBP:  
`movl %esp,%ebp`

(5) If necessary, g pushes EBX, ESI, EDI and local variables:

```
pushl %ebx
pushl localvar1
pushl localvar2
pushl localvar3
```

Prolog

High memory

(6) g uses parameters and local variables to compute a return value, and moves that value to EAX:

```
movl 8(%ebp), ???
movl 12(%ebp), ???
...
movl -8(%ebp), ???
movl -12(%ebp), ???
...
movl ???, %eax
```

(7) If necessary, g restores EBX, ESI, EDI

```
movl -4(%ebp), %ebx
```

(8) g copies EBP to ESP:  
movl %ebp, %esp

(9) g pops from stack into EBP:  
popl %ebp

(10) g executes ret instruction:  
ret

(11) f pops actual parameters from stack, and uses return value in EAX:

```
addl $12, %esp
movl %eax, ???
```

(12) If necessary, f restores EAX, ECX, EDX  
popl %ecx

**Epilog**
