### **2.1 ELEMENTARY SORTS**

- rules of the game
- selection sort
- insertion sort
- ▶ shellsort
- shuffling
- convex hull

#### rules of the game

Algorithms, 4th Edition · Robert Sedgewick and Kevin Wayne · Copyright © 2002–2012 · February 15, 2012 5:42:22 AM

#### Sorting problem

#### Ex. Student records in a university.

#### Sort. Rearrange array of *N* items into ascending order.

Andrews	3	А	664-480-0023	097 Little
Battle	4	С	874-088-1212	121 Whitman
Chen	3	А	991-878-4944	308 Blair
Furia	1	А	766-093-9873	101 Brown
Gazsi	4	В	766-093-9873	101 Brown
Kanaga	3	В	898-122-9643	22 Brown
Rohde	2	А	232-343-5555	343 Forbes

#### Sample sort client

- Goal. Sort any type of data.
- Ex 1. Sort random real numbers in ascending order.

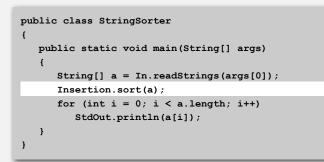

seems artificial, but stay tuned for an application

#### public class Experiment % java Experiment 10 { public static void main(String[] args) ł int N = Integer.parseInt(args[0]); Double[] a = new Double[N]; for (int i = 0; i < N; i++) a[i] = StdRandom.uniform(); Insertion.sort(a); for (int i = 0; i < N; i++) StdOut.println(a[i]); } }

0.08614716385210452 0.09054270895414829 0.10708746304898642 0.21166190071646818 0.363292849257276 0.460954145685913 0.5340026311350087 0.7216129793703496 0.9003500354411443 0.9293994908845686

Sample sort client

- Goal. Sort any type of data.
- Ex 2. Sort strings from file in alphabetical order.

% more words3.txt bed bug dad yet zoo ... all bad yes

% java StringSorter words3.txt all bad bed bug dad ... yes yet zoo

#### Callbacks

#### Goal. Sort any type of data.

Q. How can sort() know how to compare data of type Double, string, and java.io.File without any information about the type of an item's key?

#### Callback = reference to executable code.

- Client passes array of objects to sort() function.
- The sort () function calls back object's compareto () method as needed.

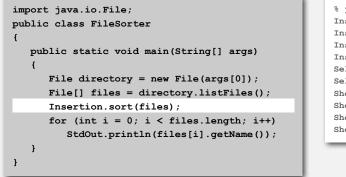

#### Implementing callbacks.

- Java: interfaces.
- C: function pointers.
- C++: class-type functors.
- C#: delegates.
- Python, Perl, ML, Javascript: first-class functions.

#### Sample sort client

Goal. Sort any type of data.

Ex 3. Sort the files in a given directory by filename.

% java FileSorter . Insertion.class Insertion.java InsertionX.class InsertionX.java Selection.class Selection.java Shell.class Shell.java ShellX.class ShellX.java

#### Callbacks: roadmap

#### client import java.io.File; public class FileSorter public static void main(String[] args) File directory = new File(args[0]); File[] files = directory.listFiles(); Insertion.sort(files); for (int i = 0; i < files.length; i++)</pre> StdOut.println(files[i].getName()); } ł

#### Comparable interface (built in to Java)

public interface Comparable<Item> public int compareTo(Item that); ł

#### object implementation

<pre>implements Comparable<file> {      public int compareTo(File b)     {          return -1;          return +1;          return 0;     } </file></pre>	public class File
<pre>public int compareTo(File b) {      return -1;      return +1;      return 0;</pre>	<pre>implements Comparable<file></file></pre>
<pre>(      return -1;      return +1;      return 0;</pre>	{
<pre>(      return -1;      return +1;      return 0;</pre>	
 return -1;  return +1;  return 0;	<pre>public int compareTo(File b)</pre>
return +1;  return 0;	ť
return +1;  return 0;	
return 0;	return -1;
return 0;	
	return +1;
}	return 0;
	}
}	}

#### sort implementation

#### public static void sort(Comparable[] a) int N = a.length; for (int i = 0; i < N; i++) for (int j = i; j > 0; j--) if (a[j].compareTo(a[j-1]) < 0)exch(a, j, j-1); else break;

key point: no dependence on File data type

#### Total order

- A total order is a binary relation  $\leq$  that satisfies
- Antisymmetry: if  $v \le w$  and  $w \le v$ , then v = w.
- Transitivity: if  $v \le w$  and  $w \le x$ , then  $v \le x$ .
- Totality: either  $v \le w$  or  $w \le v$  or both.

Ex. Integers, real numbers, alphabetical order for strings, chronological order for dates, ...

an intransitive relation

#### Comparable API

#### Implement compareTo () SO that v. compareTo (w)

- Implements a total order.
- Returns a negative integer, zero, or positive integer if v is less than, equal to, or greater than w, respectively.
- Throws an exception if incompatible types (or either is null).

Built-in comparable types. Integer, Double, String, Date, File, ... User-defined comparable types. Implement the Comparable interface.

10

12

#### Implementing the Comparable interface

Date data type. Simplified version of java.util.Date.

```
public class Date implements Comparable<Date>
ł
  private final int month, day, year;
                                                        only compare dates
   public Date(int m, int d, int y)
                                                          to other dates
     month = m;
     day = d;
     year = y;
  public int compareTo(Date that)
   ł
     if (this.year < that.year ) return -1;
     if (this.year > that.year ) return +1;
     if (this.month < that.month) return -1;
     if (this.month > that.month) return +1;
     if (this.day < that.day ) return -1;
     if (this.day > that.day ) return +1;
     return 0;
  }
}
```

#### Two useful sorting abstractions

Helper functions. Refer to data through compares and exchanges.

Less. Is item v less than w?

```
private static boolean less(Comparable v, Comparable w)
{ return v.compareTo(w) < 0; }</pre>
```

Exchange. Swap item in array a[] at index i with the one at index j.

```
private static void exch(Comparable[] a, int i, int j)
{
   Comparable swap = a[i];
   a[i] = a[j];
   a[j] = swap;
}
```

11

#### Testing

#### Goal. Test if an array is sorted.

```
private static boolean isSorted(Comparable[] a)
{
    for (int i = 1; i < a.length; i++)
        if (less(a[i], a[i-1])) return false;
        return true;
}</pre>
```

Q. If the sorting algorithm passes the test, did it correctly sort the array? A.

13

#### Selection sort demo

## selection sort

- rinsertion sor
- shuffling
  - convex hull

14

16

Selection sort

Algorithm.  $\uparrow$  scans from left to right.

#### Invariants.

- Entries the left of  $\uparrow$  (including  $\uparrow$ ) fixed and in ascending order.
- No entry to right of  $\uparrow$  is smaller than any entry to the left of  $\uparrow$ .

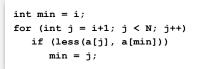

#### Selection sort inner loop

#### To maintain algorithm invariants:

• Move the pointer to the right.

i++;

• Identify index of minimum entry on right.

• Exchange into position.

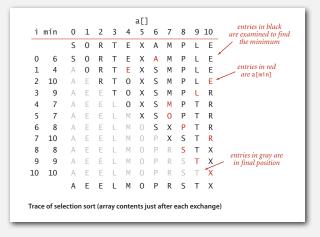

exch(a,	i,	min);	
---------	----	-------	--

in final order

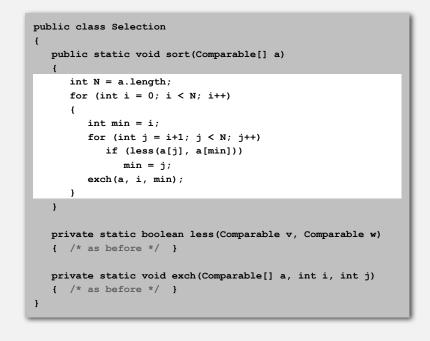

#### Selection sort: mathematical analysis

Proposition. Selection sort uses  $(N-1) + (N-2) + ... + 1 + 0 \sim N^2/2$  compares and N exchanges.

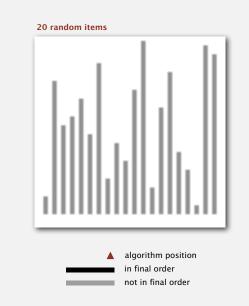

Running time insensitive to input. Quadratic time, even if input array is sorted. Data movement is minimal. Linear number of exchanges.

#### Selection sort: Java implementation

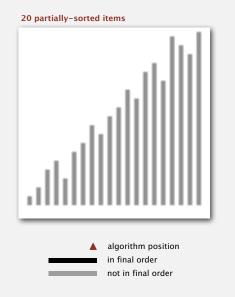

#### Selection sort: animations

http://www.sorting-algorithms.com/selection-sort

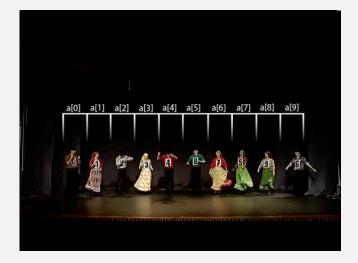

20

http://www.sorting-algorithms.com/selection-sort

insertion sort
 shellsort

#### Selection sort: Gypsy folk dance

#### 21

#### Insertion sort demo

23

22

Algorithm.  $\uparrow$  scans from left to right.

#### Invariants.

- Entries to the left of  $\uparrow$  (including  $\uparrow$ ) are in ascending order.
- Entries to the right of  $\uparrow$  have not yet been seen.

#### Insertion sort inner loop

#### To maintain algorithm invariants:

• Move the pointer to the right.

for (int j = i; j > 0; j--)
 if (less(a[j], a[j-1]))
 exch(a, j, j-1);
 else break;

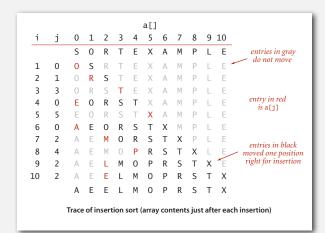

#### Insertion sort: Java implementation

public class Insertion
<pre>public static void sort(Comparable[] a) {</pre>
<pre>int N = a.length; for (int i = 0; i &lt; N; i++) for (int j = i; j &gt; 0; j) if (less(a[j], a[j-1]))</pre>
<pre>exch(a, j, j-1); else break;</pre>
<pre>} private static boolean less(Comparable v, Comparable w) { /* as before */ }</pre>
<pre>private static void exch(Comparable[] a, int i, int j) { /* as before */ } }</pre>

#### Insertion sort: mathematical analysis

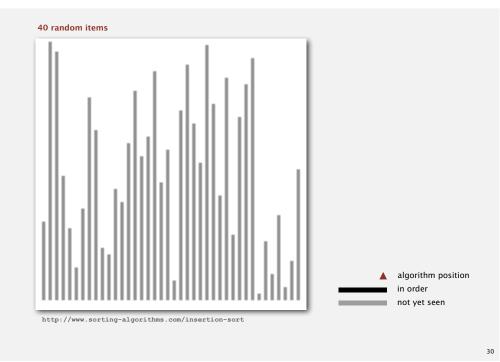

Proposition. To sort a randomly-ordered array with distinct keys, insertion sort uses ~  $\frac{1}{4} N^2$  compares and ~  $\frac{1}{4} N^2$  exchanges on average.

#### Pf. Expect each entry to move halfway back.

0         0         A         5         0         M         E         W         H         A         T         L         0         N         G         E         N         T         L         0         N         G         E         N         T         L         0         N         G         E         N         N         S         C         N         T         E         X         M         P         L           1         1         A         N         O         M         T         L         O         N         G         E         N         S         E         R         T         L         O         N         G         E         R         I         N         S         E         R         T         L         O         N         G         E         R         I         N         S         E         R         T         L         O         N																				a[ ]

#### Insertion sort: animation

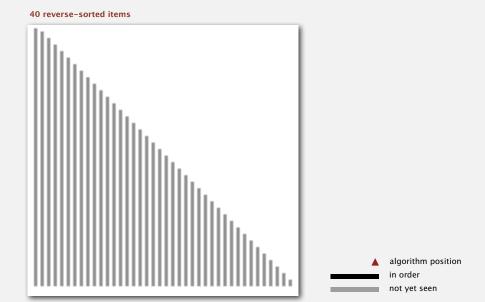

#### Insertion sort: best and worst case

Best case. If the array is in ascending order, insertion sort makes N-1 compares and 0 exchanges.

Worst case. If the array is in descending order (and no duplicates), insertion sort makes ~  $\frac{1}{2}N^2$  compares and ~  $\frac{1}{2}N^2$  exchanges.

XTSRPOMLEEA

#### Insertion sort: animation

http://www.sorting-algorithms.com/insertion-sort

#### Insertion sort: partially-sorted arrays

#### Def. An inversion is a pair of keys that are out of order.

#### Def. An array is partially sorted if the number of inversions is $\leq c N$ .

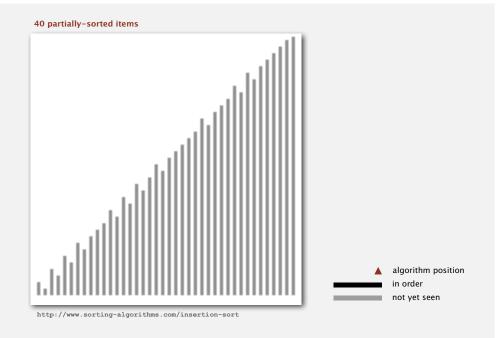

- Ex 1. A subarray of size 10 appended to a sorted subarray of size N.
- Ex 2. An array of size N with only 10 entries out of place.

 $\label{eq:proposition} \ensuremath{\mathsf{Proposition}}\xspace. For partially-sorted arrays, insertion sort runs in linear time.$ 

Pf. Number of exchanges equals the number of inversions.

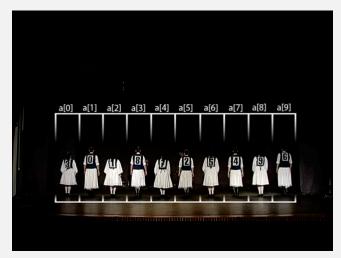

number of compares = exchanges + (N - 1)

#### Insertion sort: animation

33

#### Insertion sort: Romanian folk dance

Shuffling. Rearrange an array so that result is a uniformly random permutation.

#### How to shuffle an array

Shuffling. Rearrange an array so that result is a uniformly random permutation.

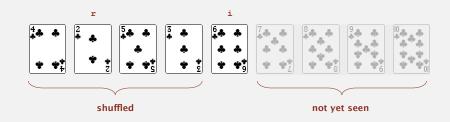

37

#### Knuth shuffle demo

#### Knuth shuffle

Knuth shuffle. [Fisher-Yates 1938]

- In iteration i, pick integer r between 0 and i uniformly at random.
- Swap a[i] and a[r].

Proposition. Knuth shuffling algorithm produces a uniformly random permutation of the input array in linear time.

39

#### Knuth shuffle

#### Knuth shuffle. [Fisher-Yates 1938]

- In iteration i, pick integer r between 0 and i uniformly at random.
- Swap a[i] and a[r].

#### Knuth shuffle

ł

. . .

ł

}

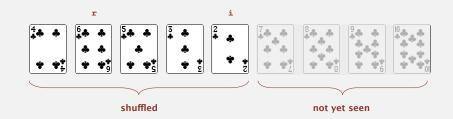

#### Knuth shuffle. [Fisher-Yates 1938]

public class StdRandom

- In iteration i, pick integer r between 0 and i uniformly at random.
- Swap a[i] and a[r].

common bug: between 0 and N - 1 correct variant: between i and N - 1

between 0 and i

Proposition. Knuth shuffling algorithm produces a uniformly random permutation of the input array in linear time.

idom

41

43

#### Shuffle sort

#### Shuffle sort.

- Generate a random real number for each array entry.
- Sort the array.

Proposition. Shuffle sort produces a uniformly random permutation

of the input array, provided no duplicate values.

assuming real numbers uniformly at random

# }

int N = a.length;

exch(a, i, r);

#### Shuffle sort

#### Shuffle sort.

• Generate a random real number for each array entry.

public static void shuffle(Object[] a)

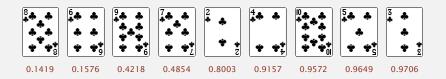

int r = StdRandom.uniform(i + 1);

for (int i = 0; i < N; i++)

• Sort the array.

vuseful for shuffling columns in a spreadsheet

uniformly at random

Proposition. Shuffle sort produces a uniformly random permutation of the input array, provided no duplicate values.

Microsoft antitrust probe by EU. Microsoft agreed to provide a randomized ballot screen for users to select browser in Windows 7.

#### War story (Microsoft)

Microsoft antitrust probe by EU. Microsoft agreed to provide a randomized ballot screen for users to select browser in Windows 7.

Solution? Implement shuffle sort by making comparator always return a random answer.

War story (online poker)

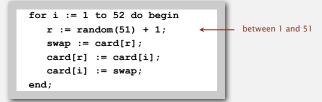

Texas hold'em poker. Software must shuffle electronic cards.

How We Learned to Cheat at Online Poker: A Study in Software Security http://itmanagement.earthweb.com/entdev/article.php/616221

#### War story (online poker)

#### Shuffling algorithm in FAQ at www.planetpoker.com

- Bug 1. Random number r never 52  $\Rightarrow$  52<sup>nd</sup> card can't end up in 52<sup>nd</sup> place.
- Bug 2. Shuffle not uniform (should be between i and 51).
- Bug 3. random() uses 32-bit seed  $\Rightarrow 2^{32}$  possible shuffles.
- Bug 4. Seed = milliseconds since midnight  $\Rightarrow$  86.4 million possible shuffles.

48

*"The generation of random numbers is too important to be left to chance."* — *Robert R. Coveyou* 

#### War story (online poker)

Best practices for shuffling (if your business depends on it).

- Use a hardware random-number generator that has passed both the FIPS 140-2 and the NIST statistical test suites.
- Continuously monitor statistic properties: hardware random-number generators are fragile and fail silently.
- Use an unbiased shuffling algorithm.

#### selection sort

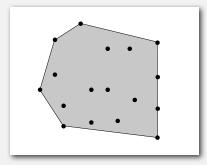

- insertion sort
- shellsort

#### ▶ convex hull

Bottom line. Shuffling a deck of cards is hard!

#### Convex hull

The convex hull of a set of N points is the smallest perimeter fence enclosing the points.

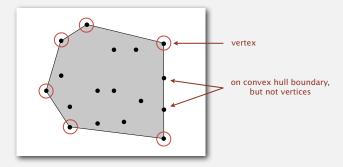

#### Equivalent definitions.

- Smallest convex set containing all the points.
- Smallest area convex polygon enclosing the points.
- Convex polygon enclosing the points, whose vertices are points in the set.

#### Convex hull

The convex hull of a set of N points is the smallest perimeter fence enclosing the points.

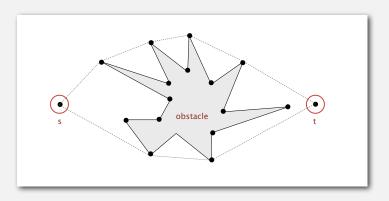

Convex hull output. Sequence of vertices in counterclockwise order.

49

Mechanical algorithm. Hammer nails perpendicular to plane; stretch elastic rubber band around points.

http://www.dfanning.com/math\_tips/convexhull\_1.gif

Robot motion planning. Find shortest path in the plane from s to t that avoids a polygonal obstacle.

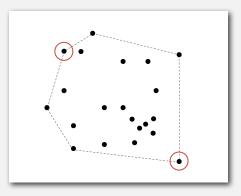

Fact. Shortest path is either straight line from s to t or it is one of two polygonal chains of convex hull.

53

#### Convex hull application: farthest pair

Farthest pair problem. Given N points in the plane, find a pair of points with the largest Euclidean distance between them.

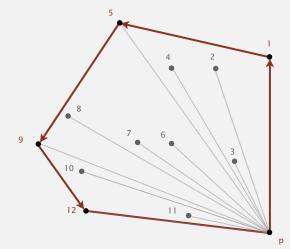

Fact. Farthest pair of points are extreme points on convex hull.

#### Convex hull: geometric properties

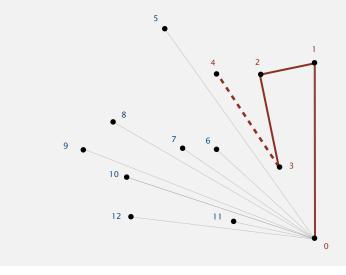

Fact. Can traverse the convex hull by making only counterclockwise turns.

Fact. The vertices of convex hull appear in increasing order of polar angle with respect to point p with lowest y-coordinate.

#### Convex hull: Graham scan

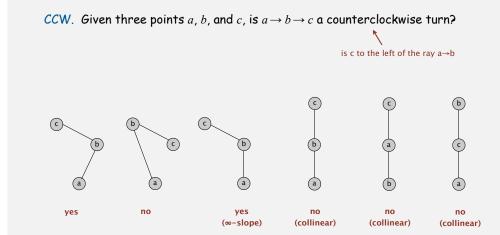

- Choose point p with smallest y-coordinate.
- Sort points by polar angle with p.
- Consider points in order, and discard unless that would create a ccw turn.

#### Graham scan: implementation challenges

- Q. How to find point p with smallest y-coordinate?
- A. Define a total order, comparing y-coordinate. [next lecture]
- Q. How to sort points by polar angle with respect to p?
- A. Define a total order for each point p. [next lecture]
- Q. How to determine whether  $p_1 \rightarrow p_2 \rightarrow p_3$  is a counterclockwise turn?
- A. Computational geometry. [next two slides]
- Q. How to sort efficiently?
- A. Mergesort sorts in  $N \log N$  time. [next lecture]
- Q. How to handle degeneracies (three or more points on a line)?
- A. Requires some care, but not hard. [see booksite]

#### Implementing ccw

Lesson. Geometric primitives are tricky to implement.

- Dealing with degenerate cases.
- Coping with floating-point precision.

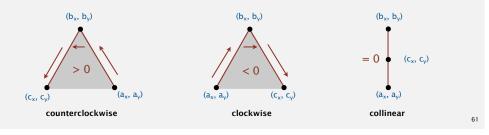

57

#### Implementing ccw

- CCW. Given three points a, b, and c, is  $a \rightarrow b \rightarrow c$  a counterclockwise turn?
- Determinant (or cross product) gives twice signed area of planar triangle.

	$a_x$	$a_y$	1	$= (b_x - a_x)(c_y - a_y) - (b_y - a_y)(c_x - a_x)$ (b - 3) × (c - 3)
$2 \times Area(a, b, c) =$	$b_x$	$b_y$	1	$= (b_x - a_x)(c_y - a_y) - (b_y - a_y)(c_x - a_x)$
	$C_x$	$c_y$	1	$(b - a) \times (c - a)$

- If signed area > 0, then  $a \rightarrow b \rightarrow c$  is counterclockwise.
- If signed area < 0, then  $a \rightarrow b \rightarrow c$  is clockwise.
- If signed area = 0, then  $a \rightarrow b \rightarrow c$  are collinear.

#### Immutable point data type

```
public class Point2D
{
   private final double x;
  private final double y;
   public Point(double x, double y)
   £
      this.x = x;
      this.y = y;
                                                         danger of
   }
                                                        floating-point
                                                       roundoff error
   . . .
  public static int ccw(Point a, Point b, Point c)
  ł
      int area2 = (b.x-a.x)*(c.y-a.y) - (b.y-a.y)*(c.x-a.x);
      if
               (area2 < 0) return -1; // clockwise</pre>
      else if (area2 > 0) return +1; // counter-clockwise
      else
                           return 0; // collinear
  }
}
```
