gorithms

2-3 tree

Allow 1 or 2 keys per node.

- 2-node: one key, two children.
- 3-node: two keys, three children.

Symmetric order. Inorder traversal yields keys in ascending order. Perfect balance. Every path from root to null link has same length.

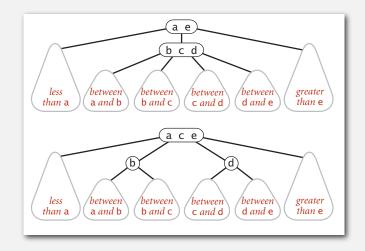

▶ 2-3 search trees ▶ red-black BSTs

4

Local transformations in a 2-3 tree

Splitting a 4-node is a local transformation: constant number of operations.

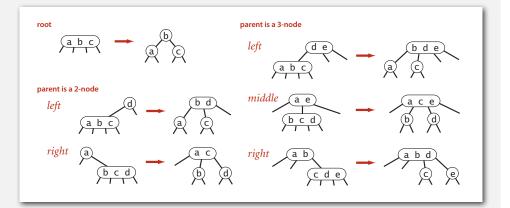

6

8

Global properties in a 2-3 tree

Invariants. Maintains symmetric order and perfect balance.

Pf. Each transformation maintains symmetric order and perfect balance.

2-3 tree: performance

Perfect balance. Every path from root to null link has same length.

Tree height.

- Worst case:
- Best case:

Perfect balance. Every path from root to null link has same length.

Tree height.

- Worst case: lg N. [all 2-nodes]
- Best case: $\log_3 N \approx .631 \lg N$. [all 3-nodes]
- Between 12 and 20 for a million nodes.
- Between 18 and 30 for a billion nodes.

Guaranteed logarithmic performance for search and insert.

ST implementations: summary

implementation	worst-case cost (after N inserts)			average case (after N random inserts)			ordered	key
	search	insert	delete	search hit	insert	delete	iteration?	interface
sequential search (unordered list)	Ν	Ν	N	N/2	Ν	N/2	no	equals()
binary search (ordered array)	lg N	Ν	N	lg N	N/2	N/2	yes	compareTo()
BST	Ν	Ν	N	1.39 lg N	1.39 lg N	?	yes	compareTo()
2-3 tree	c lg N	c lg N	c lg N	c lg N	c lg N	c lg N	yes	compareTo()

constants depend upon implementation

10

12

2-3 tree: implementation?

Direct implementation is complicated, because:

- Maintaining multiple node types is cumbersome.
- Need multiple compares to move down tree.
- Need to move back up the tree to split 4-nodes.
- Large number of cases for splitting.

Bottom line. Could do it, but there's a better way.

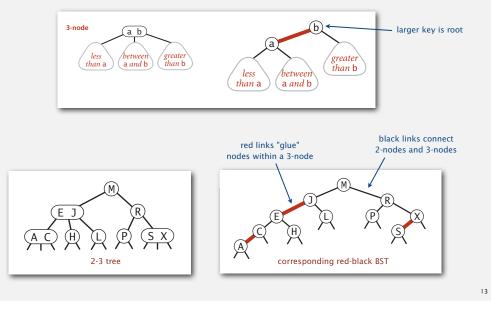

▶ 2-3 search trees

▶ red-black BSTs

B-trees

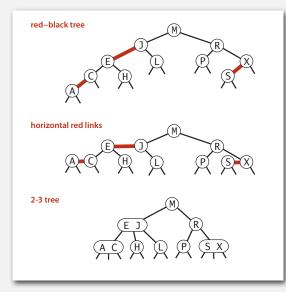

Left-leaning red-black BSTs (Guibas-Sedgewick 1979 and Sedgewick 2007)

- 1. Represent 2-3 tree as a BST.
- 2. Use "internal" left-leaning links as "glue" for 3-nodes.

Left-leaning red-black BSTs: 1-1 correspondence with 2-3 trees

Key property. 1-1 correspondence between 2-3 and LLRB.

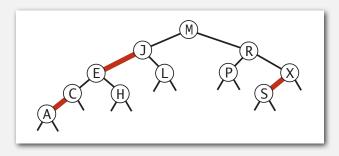

An equivalent definition

A BST such that:

- No node has two red links connected to it.
- Every path from root to null link has the same number of black links.
- Red links lean left.

"perfect black balance"

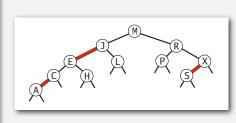

Search implementation for red-black BSTs

Observation. Search is the same as for elementary BST (ignore color).

but runs faster because of better balance

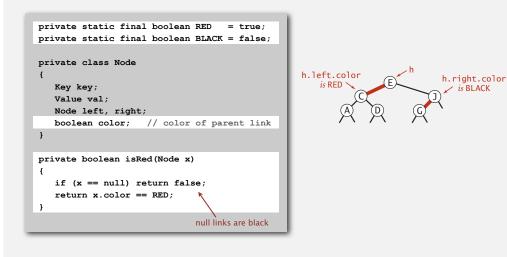

public Val get(Key key)
{
 Node x = root;
 while (x != null)
 {
 int cmp = key.compareTo(x.key);
 if (cmp < 0) x = x.left;
 else if (cmp > 0) x = x.right;
 else if (cmp == 0) return x.val;
 }
 return null;
}

Remark. Most other ops (e.g., ceiling, selection, iteration) are also identical.

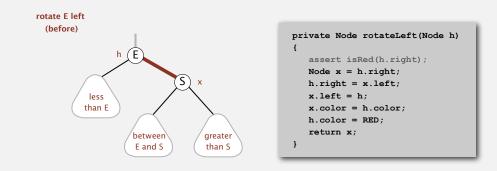

Red-black BST representation

Each node is pointed to by precisely one link (from its parent) \Rightarrow can encode color of links in nodes.

Elementary red-black BST operations

Left rotation. Orient a (temporarily) right-leaning red link to lean left.

Invariants. Maintains symmetric order and perfect black balance.

18

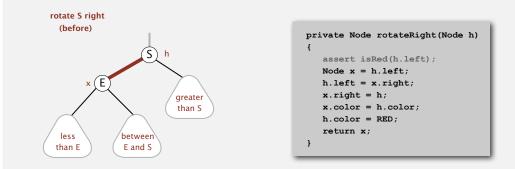

Elementary red-black BST operations

Left rotation. Orient a (temporarily) right-leaning red link to lean left.

Elementary red-black BST operations

Right rotation. Orient a left-leaning red link to (temporarily) lean right.

Invariants. Maintains symmetric order and perfect black balance.

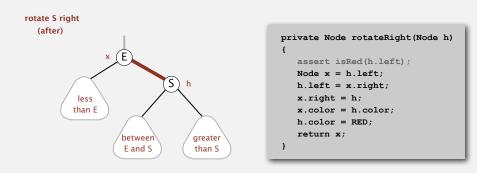

Invariants. Maintains symmetric order and perfect black balance.

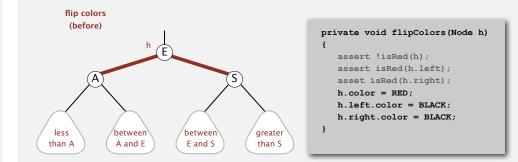

19

Right rotation. Orient a left-leaning red link to (temporarily) lean right.

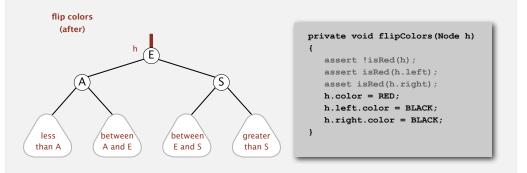

Invariants. Maintains symmetric order and perfect black balance.

21

Elementary red-black BST operations

Color flip. Recolor to split a (temporary) 4-node.

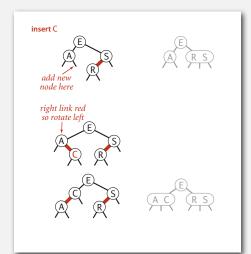

Invariants. Maintains symmetric order and perfect black balance.

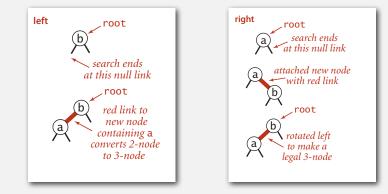

Insertion in a LLRB tree: overview

Basic strategy. Maintain 1-1 correspondence with 2-3 trees by applying elementary red-black BST operations.

Invariants. Maintains symmetric order and perfect black balance.

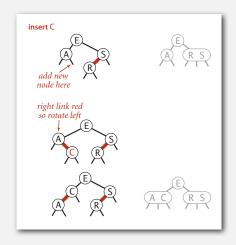

Warmup 1. Insert into a tree with exactly 1 node.

Insertion in a LLRB tree

Case 1. Insert into a 2-node at the bottom.

- Do standard BST insert; color new link red.
- If new red link is a right link, rotate left.

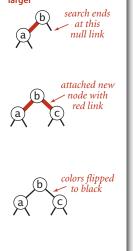

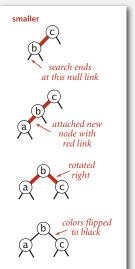

26

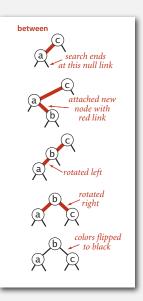

28

Warmup 2. Insert into a tree with exactly 2 nodes.

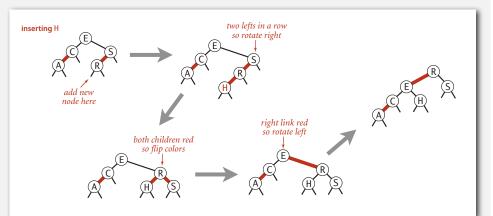

Insertion in a LLRB tree

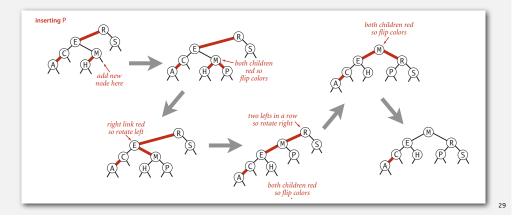

Case 2. Insert into a 3-node at the bottom.

- Do standard BST insert; color new link red.
- Rotate to balance the 4-node (if needed).
- Flip colors to pass red link up one level.
- Rotate to make lean left (if needed).

Case 2. Insert into a 3-node at the bottom.

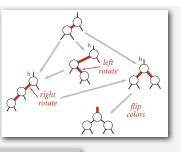

- Do standard BST insert; color new link red.
- Rotate to balance the 4-node (if needed).
- Flip colors to pass red link up one level.
- Rotate to make lean left (if needed).
- Repeat case 1 or case 2 up the tree (if needed).

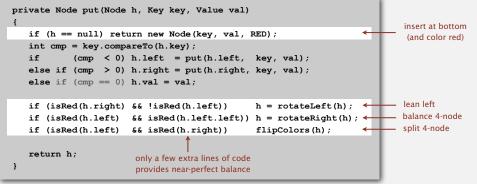

Insertion in a LLRB tree: Java implementation

Same code for both cases.

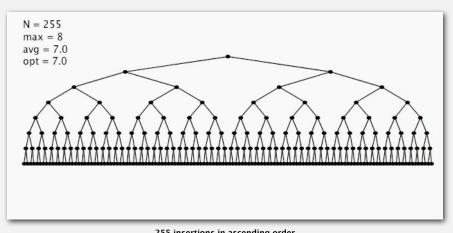

- Right child red, left child black: rotate left.
- Left child, left-left grandchild red: rotate right.
- Both children red: flip colors.

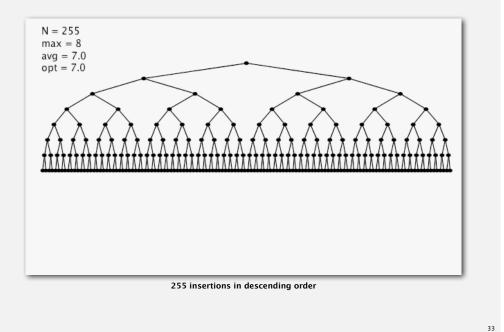

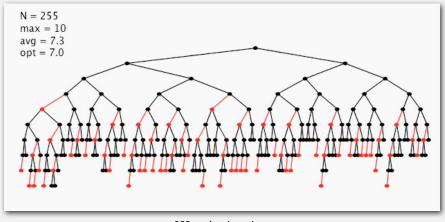

LLRB tree insertion demo

Insertion in a LLRB tree: visualization

Insertion in a LLRB tree: visualization

255 random insertions

34

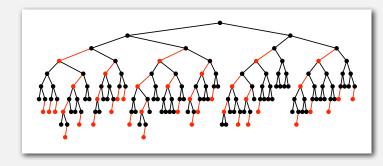

36

Balance in LLRB trees

Proposition. Height of tree is $\leq 2 \lg N$ in the worst case.

Pf.

- Every path from root to null link has same number of black links.
- Never two red links in-a-row.

ST implementations: summary

implementation	worst-case cost (after N inserts)				average case N random ins	ordered	key	
	search	insert	delete	search hit	insert	delete	iteration?	interface
sequential search (unordered list)	N	N	N	N/2	N	N/2	no	equals()
binary search (ordered array)	lg N	N	Ν	lg N	N/2	N/2	yes	compareTo()
BST	N	N	N	1.39 lg N	1.39 lg N	?	yes	compareTo()
2-3 tree	c lg N	c lg N	c lg N	c lg N	c lg N	c lg N	yes	compareTo()
red-black BST	2 lg N	2 lg N	2 lg N	1.00 lg N *	1.00 lg N *	1.00 lg N *	yes	compareTo()

* exact value of coefficient unknown but extremely close to 1

Property. Height of tree is ~ $1.00 \lg N$ in typical applications.

War story: why red-black?

Xerox PARC innovations. [1970s]

A DICHROMATIC FRAMEWORK FOR BALANCED TREES

and

Leo J. Guibas Xerox Palo Alto Research Center, Palo Alto, California, and Carnegie-Mellon University Robert Sedgewick* Program in Computer Science Brown University Providence, R. I.

XEROX

ABSTRACT In this paper we present a uniform framework for the implementation and study of balanced tree algorithms. We show how to imhed in this

the way down towards a leaf. As we will see, this has a number of significant advantages over the older methods. We shall examine a number of variations on a common theme and exhibit full implementations which are notable for their brevity. One implementations examined cardility, and some properties about its

Xerox Alto

37

War story: red-black BSTs

Telephone company contracted with database provider to build real-time database to store customer information.

Database implementation.

- Red-black BST search and insert; Hibbard deletion.
- Exceeding height limit of 80 triggered error-recovery process.

allows for up to 240 keys

Extended telephone service outage.

- Main cause = height bounded exceeded!
- Telephone company sues database provider.
- Legal testimony:

"If implemented properly, the height of a red-black BST with N keys is at most 2 lg N." — expert witness

38

40

File system model

Page. Contiguous block of data (e.g., a file or 4,096-byte chunk). Probe. First access to a page (e.g., from disk to memory).

Property. Time required for a probe is much larger than time to access data within a page.

Cost model. Number of probes.

Goal. Access data using minimum number of probes.

2-3 search tree

red-black BSTs

B-trees

B-trees (Bayer-McCreight, 1972)

B-tree. Generalize 2-3 trees by allowing up to M - 1 key-link pairs per node.

K

each red key is a copy

of min key in subtree

K M N O P

external 5-node (full)

Anatomy of a B-tree set (M = 6)

2-node

choose M as large as possible so

that M links fit in a page, e.g., M = 1024

internal 3-node

all nodes except the root are 3-, 4- or 5-nodes

external 4-node

UWXY

KQU

QRT

- At least 2 key-link pairs at root.
- At least M/2 key-link pairs in other nodes.
- External nodes contain client keys.

* D H

DEF

client keys (black)

are in external nodes

sentinel key

externa

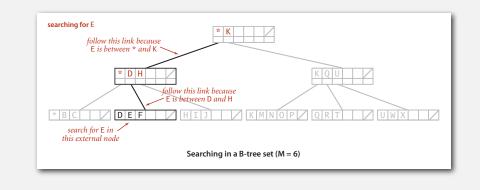

3-node

* B C

• Internal nodes contain copies of keys to guide search.

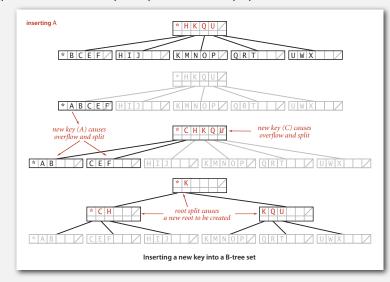

- Start at root.
- Find interval for search key and take corresponding link.
- · Search terminates in external node.

Insertion in a B-tree

- Search for new key.
- Insert at bottom.
- Split nodes with *M* key-link pairs on the way up the tree.

Balance in B-tree

Proposition. A search or an insertion in a B-tree of order M with N keys requires between $\log_{M-1} N$ and $\log_{M/2} N$ probes.

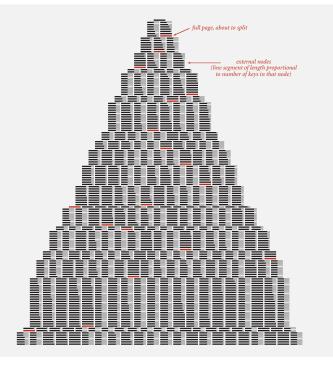

Pf. All internal nodes (besides root) have between M/2 and M-1 links.

 $\log_{M/2} N \leq 4$

M = 1024; N = 62 billion In practice. Number of probes is at most 4.

Optimization. Always keep root page in memory.

Building a large B tree

Red-black BSTs in the wild

Common sense. Sixth sense. Together they're the FBI's newest team.

Balanced trees in the wild

Red-black trees are widely used as system symbol tables.

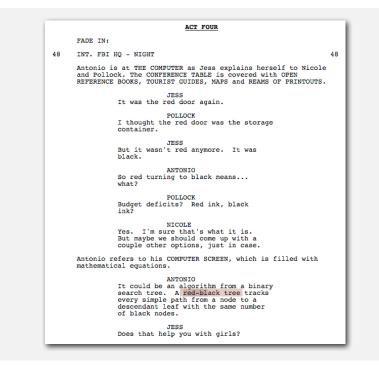

- Java: java.util.TreeMap, java.util.TreeSet.
- C++ STL: map, multimap, multiset.
- Linux kernel: completely fair scheduler, linux/rbtree.h.

B-tree variants. B+ tree, B*tree, B# tree, ...

B-trees (and variants) are widely used for file systems and databases.

- Windows: HPFS.
- Mac: HFS, HFS+.
- Linux: ReiserFS, XFS, Ext3FS, JFS.
- Databases: ORACLE, DB2, INGRES, SQL, PostgreSQL.
