

# COMBINATORIAL SEARCH

- ▶ permutations
- ▶ backtracking
- ▶ counting
- ▶ subsets
- ▶ paths in a graph

Algorithms, 4<sup>th</sup> Edition · Robert Sedgewick and Kevin Wayne · Copyright © 2002–2012 · May 2, 2012 6:06:25 AM

## Overview

**Exhaustive search.** Iterate through all elements of a search space.

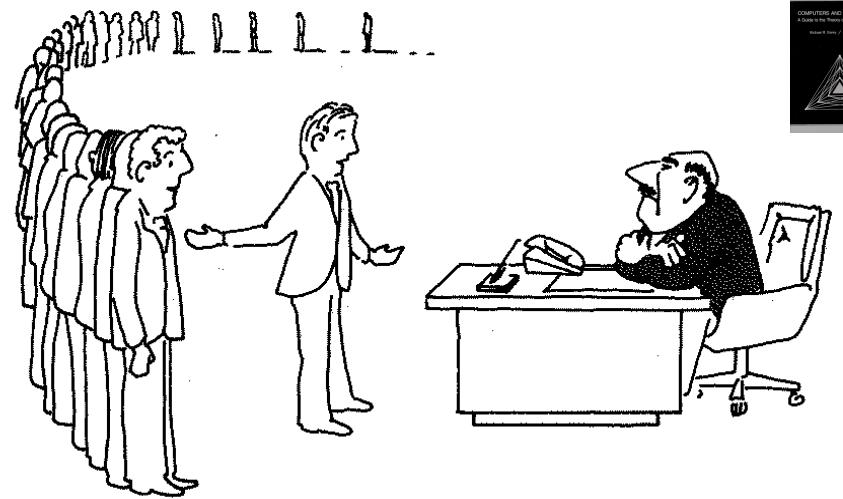

**Applicability.** Huge range of problems (include intractable ones).

**Caveat.** Search space is typically exponential in size ⇒ effectiveness may be limited to relatively small instances.

**Backtracking.** Systematic method for examining **feasible** solutions to a problem, by systematically pruning infeasible ones.

## Implications of NP-completeness

"I can't find an efficient algorithm, but neither can all these famous people."

## Warmup: enumerate N-bit strings

**Goal.** Process all  $2^N$  bit strings of length  $N$ .

- Maintain array  $a[]$  where  $a[i]$  represents bit  $i$ .
- Simple recursive method does the job.

$N = 3$	$N = 4$
0 0 0	0 0 0 0
0 0 1	0 0 0 1
0 0 0	0 0 1 0
0 1 0	0 0 1 1
0 1 1	0 1 0 0
0 1 0	0 1 0 1
0 0 0	0 1 1 0
1 0 0	0 1 1 1
1 0 1	1 0 0 0
1 0 0	1 0 0 1
1 1 0	1 0 1 0
1 1 1	1 0 1 1
1 1 0	1 1 0 0
1 0 0	1 1 0 1
0 0 0	1 1 1 0
1 1 1	1 1 1 1

```
// enumerate bits in a[k] to a[N-1]
private void enumerate(int k)
{
    if (k == N)
        process();
    else
        enumerate(k+1);
    a[k] = 1;
    enumerate(k+1);
    a[k] = 0; // clean up
}
```

**Remark.** Equivalent to counting in binary from 0 to  $2^N - 1$ .

## Warmup: enumerate N-bit strings

```
public class BinaryCounter
{
    private int N; // number of bits
    private int[] a; // a[i] = ith bit

    public BinaryCounter(int N)
    {
        this.N = N;
        this.a = new int[N];
        enumerate(0);
    }

    private void process()
    {
        for (int i = 0; i < N; i++)
            StdOut.print(a[i] + " ");
        StdOut.println();
    }

    private void enumerate(int k)
    {
        if (k == N)
        { process(); return; }
        enumerate(k+1);
        a[k] = 1;
        enumerate(k+1);
        a[k] = 0;
    }
}
```

```
public static void main(String[] args)
{
    int N = Integer.parseInt(args[0]);
    new BinaryCounter(N);
}
```

all programs in this lecture are variations on this theme

```
% java BinaryCounter 4
0 0 0 0
0 0 0 1
0 0 1 0
0 0 1 1
0 1 0 0
0 1 0 1
0 1 1 0
0 1 1 1
1 0 0 0
1 0 0 1
1 0 1 0
1 0 1 1
1 1 0 0
1 1 0 1
1 1 1 0
1 1 1 1
```

## N-rooks problem

Q. How many ways are there to place  $N$  rooks on an  $N$ -by- $N$  board so that no rook can attack any other?

```
int[] a = { 2, 0, 1, 3, 6, 7, 4, 5 };
```

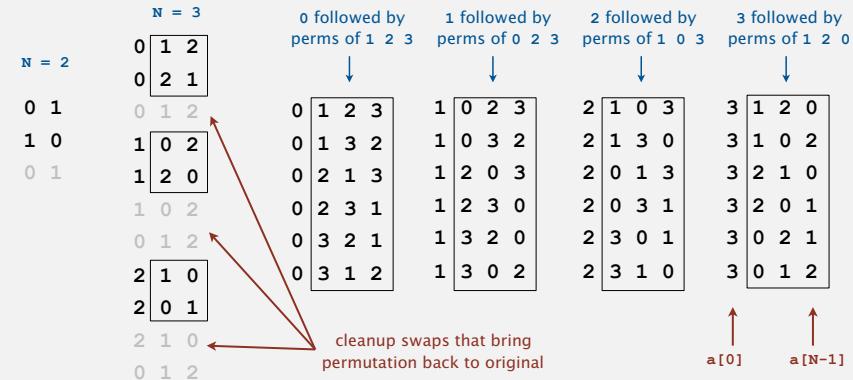

Representation. No two rooks in the same row or column  $\Rightarrow$  permutation.

Challenge. Enumerate all  $N!$  permutations of  $N$  integers 0 to  $N - 1$ .

## Enumerating permutations

Recursive algorithm to enumerate all  $N!$  permutations of  $N$  elements.

- Start with permutation  $a[0]$  to  $a[N-1]$ .
- For each value of  $i$ :
  - swap  $a[i]$  into position 0
  - enumerate all  $(N-1)!$  permutations of  $a[1]$  to  $a[N-1]$
  - clean up (swap  $a[i]$  back to original position)

7

8

## Enumerating permutations

Recursive algorithm to enumerate all  $N!$  permutations of  $N$  elements.

- Start with permutation  $a[0]$  to  $a[N-1]$ .
- For each value of  $i$ :
  - swap  $a[i]$  into position 0
  - enumerate all  $(N-1)!$  permutations of  $a[1]$  to  $a[N-1]$
  - clean up (swap  $a[i]$  back to original position)

```
// place N-k rooks in a[k] to a[N-1]
private void enumerate(int k)
{
    if (k == N)
        { process(); return; }

    for (int i = k; i < N; i++)
    {
        exch(k, i);
        enumerate(k+1);
        exch(i, k);   ← clean up
    }
}
```

% java Rooks 4	
0 1 2 3	0 followed by perms of 1 2 3
0 1 3 2	
0 2 1 3	
0 2 3 1	
0 3 2 1

9

## Enumerating permutations

```
public class Rooks
{
    private int N;
    private int[] a; // bits (0 or 1)

    public Rooks(int N)
    {
        this.N = N;
        a = new int[N];
        for (int i = 0; i < N; i++)
            a[i] = i;           ← initial permutation
        enumerate(0);
    }

    private void enumerate(int k)
    { /* see previous slide */ }

    private void exch(int i, int j)
    { int t = a[i]; a[i] = a[j]; a[j] = t; }

    public static void main(String[] args)
    {
        int N = Integer.parseInt(args[0]);
        new Rooks(N);
    }
}
```

```
% java Rooks 2
0 1
1 0

% java Rooks 3
0 1 2
0 2 1
1 0 2
1 2 0
2 1 0
2 0 1
```

10

4-rooks search tree

11

N-rooks problem: back-of-envelope running time estimate

Slow way to compute  $N!$ .

```
% java Rooks 7 | wc -l
5040
← instant

% java Rooks 8 | wc -l
40320
← 1.6 seconds

% java Rooks 9 | wc -l
362880
← 15 seconds

% java Rooks 10 | wc -l
3628800
← 170 seconds

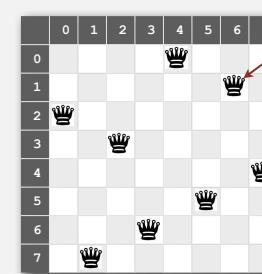

% java Rooks 25 | wc -l
...
← forever
```

Hypothesis. Running time is about  $2(N! / 8!)$  seconds.

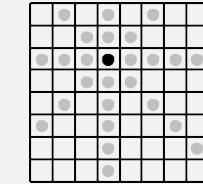

12

## N-queens problem

Q. How many ways are there to place  $N$  queens on an  $N$ -by- $N$  board so that no queen can attack any other?

$a[1] = 6$  means the queen from row 1 is in column 6

```
int[] a = { 2, 7, 3, 6, 0, 5, 1, 4 };
```

Representation. No two queens in the same row or column  $\Rightarrow$  permutation.

Additional constraint. No diagonal attack is possible.

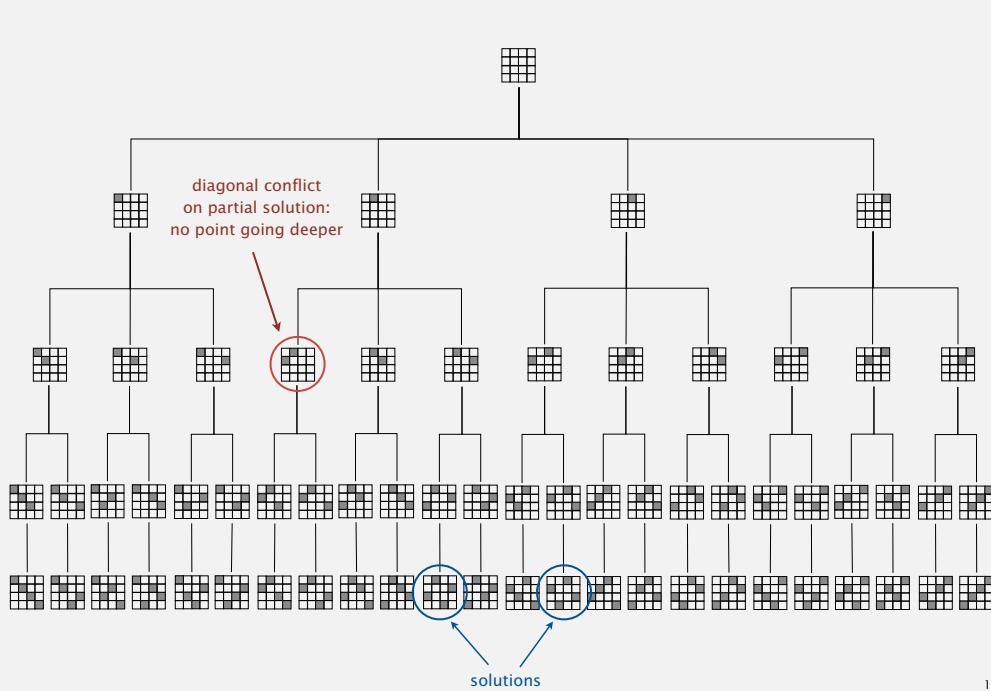

Challenge. Enumerate (or even count) the solutions.

← unlike N-rooks problem,  
nobody knows answer for  $N > 30$

13

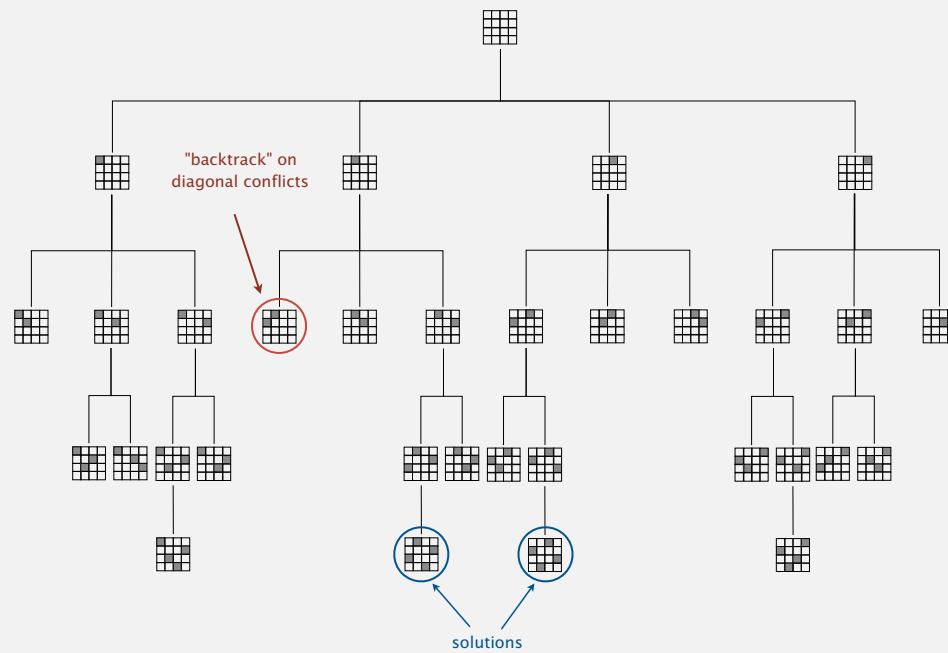

14

## 4-queens search tree

15

## 4-queens search tree (pruned)

16

## N-queens problem: backtracking solution

**Backtracking paradigm.** Iterate through elements of search space.

- When there are several possible choices, make one choice and recur.
- If the choice is a **dead end**, backtrack to previous choice, and make next available choice.

**Benefit.** Identifying dead ends allows us to **prune** the search tree.

**Ex.** [backtracking for  $N$ -queens problem]

- Dead end: a diagonal conflict.
- Pruning: backtrack and try next column when diagonal conflict found.

## N-queens problem: backtracking solution

```
private boolean canBacktrack(int k)
{
    for (int i = 0; i < k; i++)
    {
        if ((a[i] - a[k]) == (k - i)) return true;
        if ((a[k] - a[i]) == (k - i)) return true;
    }
    return false;
}

// place N-k queens in a[k] to a[N-1]
private void enumerate(int k)
{
    if (k == N)
    { process(); return; }

    for (int i = k; i < N; i++)
    {
        exch(k, i);
        if (!canBacktrack(k)) enumerate(k+1);
        exch(i, k);
    }
}
```

```
% java Queens 4
1 3 0 2
2 0 3 1

% java Queens 5
0 2 4 1 3
0 3 1 4 2
1 3 0 2 4
1 4 2 0 3
2 0 3 1 4
2 4 1 3 0
3 1 4 2 0
3 0 2 4 1
4 1 3 0 2
4 2 0 3 1

% java Queens 6
1 3 5 0 2 4
2 5 1 4 0 3
3 0 4 1 5 2
4 2 0 5 3 1
```

17

## N-queens problem: effectiveness of backtracking

Pruning the search tree leads to enormous time savings.

N	$Q(N)$	$N!$
2	0	2
3	0	6
4	2	24
5	10	120
6	4	720
7	40	5,040
8	92	40,320
9	352	362,880
10	724	3,628,800
11	2,680	39,916,800
12	14,200	479,001,600
13	73,712	6,227,020,800
14	365,596	87,178,291,200

19

```
% java Queens 13 | wc -l
73712 ← 1.1 seconds

% java Queens 14 | wc -l
365596 ← 5.4 seconds

% java Queens 15 | wc -l
2279184 ← 29 seconds

% java Queens 16 | wc -l
14772512 ← 210 seconds

% java Queens 17 | wc -l
...
...
```

**Hypothesis.** Running time is about  $(N! / 2.5^N) / 43,000$  seconds.

**Conjecture.**  $Q(N) \sim N! / c^N$ , where  $c$  is about 2.54.

18

20

## Counting: Java implementation

**Goal.** Enumerate all  $N$ -digit base- $R$  numbers.

**Solution.** Generalize binary counter in lecture warmup.

```
// enumerate base-R numbers in a[k] to a[N-1]
private static void enumerate(int k)
{
    if (k == N)
        process(); return;

    for (int r = 0; r < R; r++)
    {
        a[k] = r;
        enumerate(k+1);
    }
    a[k] = 0;           ← cleanup not needed; why?
}
```

```
% java Counter 2 4
0 0
0 1
0 2
0 3
1 0
1 1
1 2
1 3
2 0
2 1
2 2
2 3
3 0
3 1
3 2
3 3
```

```
% java Counter 3 2
0 0 0
0 0 1
0 1 0
0 1 1
1 0 0
1 0 1
1 1 0
1 1 1
```

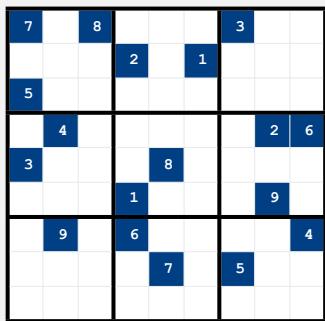

a[0] a[N-1]

22

21

## Counting application: Sudoku

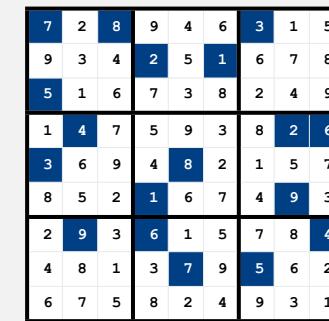

**Goal.** Fill 9-by-9 grid so that every row, column, and box contains each of the digits 1 through 9.

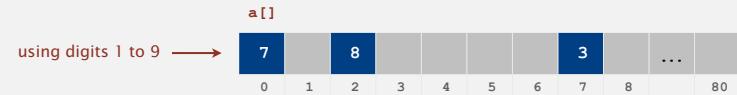

23

## Counting application: Sudoku

**Goal.** Fill 9-by-9 grid so that every row, column, and box contains each of the digits 1 through 9.

**Solution.** Enumerate all 81-digit base-9 numbers (with backtracking).

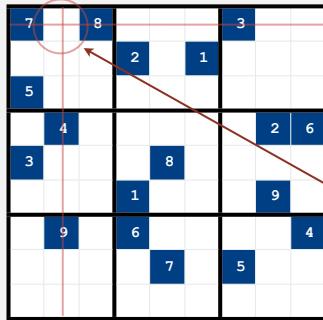

24

## Sudoku: backtracking solution

Iterate through elements of search space.

- For each empty cell, there are 9 possible choices.
- Make one choice and recur.
- If you find a conflict in row, column, or box, then backtrack.

backtrack on 3, 4, 5, 7, 8, 9

## Sudoku: Java implementation

```
private void enumerate(int k)
{
    if (k == 81)
    { process(); return; }

    if (a[k] != 0)
    { enumerate(k+1); return; }

    for (int r = 1; r <= 9; r++)
    {
        a[k] = r;
        if (!canBacktrack(k))
            enumerate(k+1);
    }

    a[k] = 0;
}
```

found a solution

cell k initially filled in;  
recur on next cell

try 9 possible digits  
for cell k

unless it violates a  
Sudoku constraint  
(see booksite for code)

clean up

```
% more board.txt

0 0 0 2 0 1 0 0 0
5 0 0 0 0 0 0 0 0
0 4 0 0 0 0 0 2 6
3 0 0 0 8 0 0 0 0
0 0 0 1 0 0 0 9 0
0 9 0 6 0 0 0 0 4
0 0 0 0 7 0 5 0 0
0 0 0 0 0 0 0 0 0
```

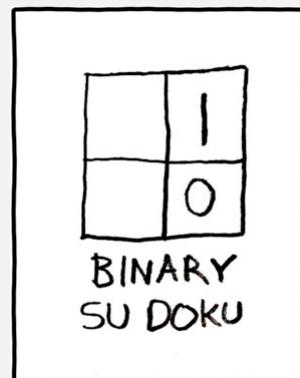

```
% java Sudoku < board.txt
7 2 8 9 4 6 3 1 5
9 3 4 2 5 1 6 7 8
5 1 6 7 3 8 2 4 9
1 4 7 5 9 3 8 2 6
3 6 9 4 8 2 1 5 7
8 5 2 1 6 7 4 9 3
2 9 3 6 1 5 7 8 4
4 8 1 3 7 9 5 6 2
6 7 5 8 2 4 9 3 1
```

25

26

## Sudoku is intractable

**Remark.** Natural generalization of Sudoku is NP-complete.

<http://xkcd.com/74>

27

- ▶ permutations
- ▶ backtracking
- ▶ counting
- ▶ subsets
- ▶ paths in a graph

28

## Enumerating subsets: natural binary encoding

Given  $N$  elements, enumerate all  $2^N$  subsets.

- Count in binary from 0 to  $2^N - 1$ .
- Maintain array  $a[]$  where  $a[i]$  represents element  $i$ .
- If 1,  $a[i]$  in subset; if 0,  $a[i]$  not in subset.

i	binary	subset	complement
0	0 0 0 0	empty	4 3 2 1
1	0 0 0 1	1	4 3 2
2	0 0 1 0	2	4 3 1
3	0 0 1 1	2 1	4 3
4	0 1 0 0	3	4 2 1
5	0 1 0 1	3 1	4 2
6	0 1 1 0	3 2	4 1
7	0 1 1 1	3 2 1	4
8	1 0 0 0	4	3 2 1
9	1 0 0 1	4 1	3 2
10	1 0 1 0	4 2	3 1
11	1 0 1 1	4 2 1	3
12	1 1 0 0	4 3	2 1
13	1 1 0 1	4 3 1	2
14	1 1 1 0	4 3 2	1
15	1 1 1 1	4 3 2 1	empty

29

## Enumerating subsets: natural binary encoding

Given  $N$  elements, enumerate all  $2^N$  subsets.

- Count in binary from 0 to  $2^N - 1$ .
- Maintain array  $a[]$  where  $a[i]$  represents element  $i$ .
- If 1,  $a[i]$  in subset; if 0,  $a[i]$  not in subset.

Binary counter from warmup does the job.

```
private void enumerate(int k)
{
    if (k == N)
        process();
    else
        enumerate(k+1);
    a[k] = 1;
    enumerate(k+1);
    a[k] = 0;
}
```

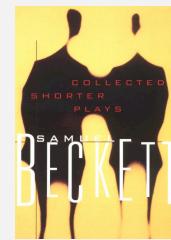

30

## Digression: Samuel Beckett play

**Quad.** Starting with empty stage, 4 characters enter and exit one at a time, such that each subset of actors appears exactly once.

code	subset	move
0 0 0 0	empty	
0 0 0 1	1	enter 1
0 0 1 1	2 1	enter 2
0 0 1 0	2	exit 1
0 1 1 0	3 2	enter 3
0 1 1 1	3 2 1	enter 1
0 1 0 1	3 1	exit 2
0 1 0 0	3	exit 1
1 1 0 0	4 3	enter 4
1 1 0 1	4 3 1	enter 1
1 1 1 1	4 3 2 1	enter 2
1 1 1 0	4 3 2	exit 1
1 0 1 0	4 2	exit 3
1 0 1 1	4 2 1	enter 1
1 0 0 1	4 1	exit 2
1 0 0 0	4	exit 1

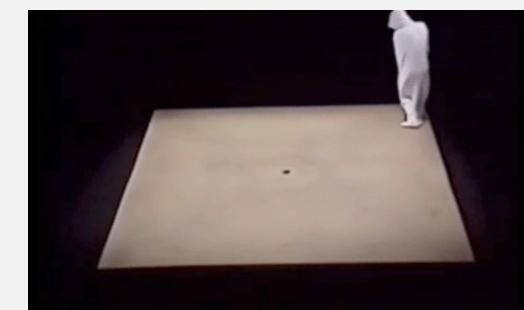

ruler function

31

## Digression: Samuel Beckett play

**Quad.** Starting with empty stage, 4 characters enter and exit one at a time, such that each subset of actors appears exactly once.

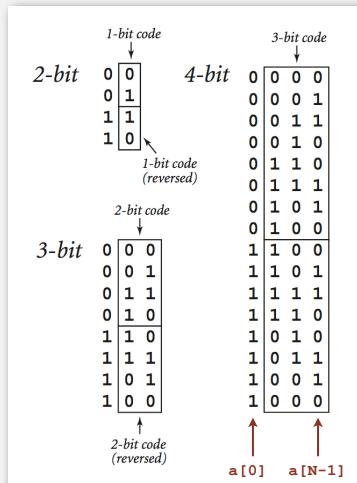

“faceless, emotionless one of the far future, a world where people are born, go through prescribed movements, fear non-being even though their lives are meaningless, and then they disappear or die.” — Sidney Homan

32

## Binary reflected gray code

Def. The  $k$ -bit binary reflected Gray code is:

- The  $(k-1)$  bit code with a 0 prepended to each word, followed by
- The  $(k-1)$  bit code in reverse order, with a 1 prepended to each word.

33

## Enumerating subsets using Gray code

Two simple changes to binary counter from warmup:

- Flip  $a[k]$  instead of setting it to 1.
- Eliminate cleanup.

### Gray code binary counter

```
// all bit strings in a[k] to a[N-1]
private void enumerate(int k)
{
    if (k == N)
        process(); return;
    enumerate(k+1);
    a[k] = 1 - a[k];
    enumerate(k+1);
}
```

0	0	0
0	0	1
0	1	1
0	1	0
1	1	0
1	1	1
1	0	1
1	0	0

### standard binary counter (from warmup)

```
// all bit strings in a[k] to a[N-1]
private void enumerate(int k)
{
    if (k == N)
        process(); return;
    enumerate(k+1);
    a[k] = 1;
    enumerate(k+1);
    a[k] = 0;
}
```

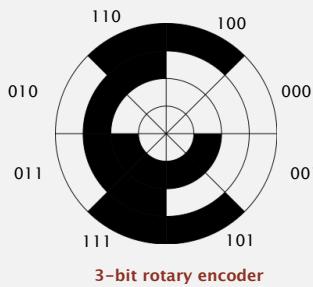

0	0	0
0	0	1
0	1	0
0	1	1
1	0	0
1	0	1
1	1	0
1	1	1

same values  
since no cleanup

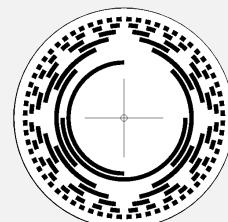

Advantage. Only one element in subset changes at a time.

34

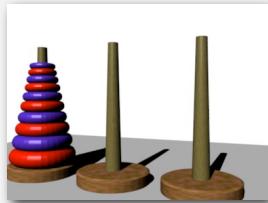

## More applications of Gray codes

3-bit rotary encoder

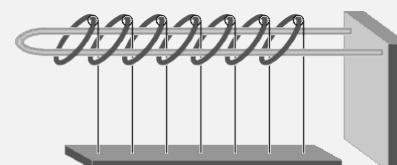

8-bit rotary encoder

Towers of Hanoi

(move  $i$ th smallest disk when bit  $i$  changes in Gray code)

Chinese ring puzzle (Baguenaudier)

(move  $i$ th ring from right when bit  $i$  changes in Gray code)

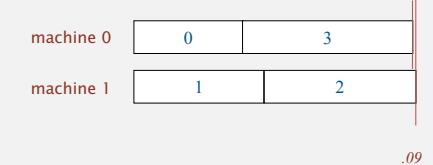

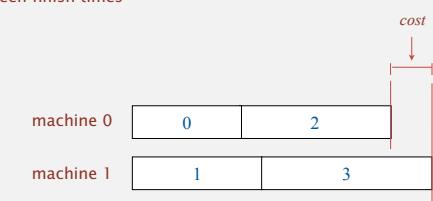

35

## Scheduling

Scheduling (set partitioning). Given  $N$  jobs of varying length, divide among two machines to minimize the makespan (time the last job finishes).

or, equivalently, difference  
between finish times

job	length
0	1.41
1	1.73
2	2.00
3	2.23

.09

Remark. This scheduling problem is NP-complete.

36

## Scheduling: improvements

Brute force. Enumerate  $2^N$  subsets; compute makespan of each; return best.

Many opportunities to improve.

- Fix first job to be on machine 0. ← factor of 2 speedup
- Maintain difference in finish times. ← factor of  $N$  speedup (using Gray code order)  
(and avoid recomputing cost from scratch)
- Backtrack when partial schedule cannot beat best known. ← huge opportunities for improvement on typical inputs
- Preprocess all  $2^k$  subsets of last  $k$  jobs;  
cache results in memory. ← reduces time to  $2^{N-k}$   
at cost of  $2^k$  memory

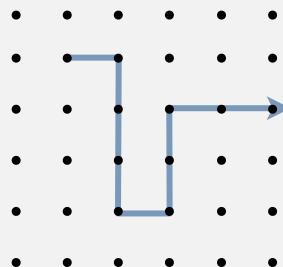

```
private void enumerate(int k)
{
    if (k == N) { process(); return; }
    if (canBacktrack(k)) return;
    enumerate(k+1);
    a[k] = 1 - a[k];
    enumerate(k+1);
}
```

37

- permutations
- backtracking
- counting
- subsets
- paths in a graph

## Enumerating all paths on a grid

Goal. Enumerate all simple paths on a grid of adjacent sites.

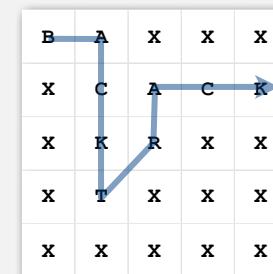

no two atoms can occupy same position at same time

Application. Self-avoiding lattice walk to model polymer chains.

39

## Enumerating all paths on a grid: Boggle

Boggle. Find all words that can be formed by tracing a simple path of adjacent cubes (left, right, up, down, diagonal).

Backtracking. Stop as soon as no word in dictionary contains string of letters on current path as a prefix ⇒ use a trie.

B  
BA  
BAX

40

## Boggle: Java implementation

```
string of letters on current path to (i, j)
```

```
private void dfs(String prefix, int i, int j)
{
    if ((i < 0 || i >= N) ||
        (j < 0 || j >= N) ||
        (visited[i][j]) ||
        !dictionary.containsAsPrefix(prefix))
        return;

    visited[i][j] = true;
    prefix = prefix + board[i][j];

    if (dictionary.contains(prefix))
        found.add(prefix);

    for (int ii = -1; ii <= 1; ii++)
        for (int jj = -1; jj <= 1; jj++)
            dfs(prefix, i + ii, j + jj);

    visited[i][j] = false;
}
```

Annotations:

- string of letters on current path to (i, j) (red arrow)
- backtrack (red arrow)
- add current character (red arrow)
- add to set of found words (red arrow)
- try all possibilities (red arrow)
- clean up (red arrow)

## Hamilton path

**Goal.** Find a simple path that visits every vertex exactly once.

visit every edge exactly once

**Remark.** Euler path easy, but Hamilton path is NP-complete.

41

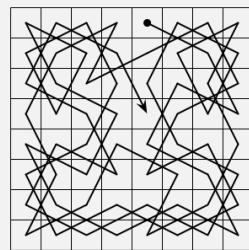

42

## Knight's tour

**Goal.** Find a sequence of moves for a knight so that (starting from any desired square) it visits every square on a chessboard exactly once.

legal knight moves

a knight's tour

**Solution.** Find a Hamilton path in knight's graph.

## Hamilton path: backtracking solution

**Backtracking solution.** To find Hamilton path starting at  $v$ :

- Add  $v$  to current path.
- For each vertex  $w$  adjacent to  $v$ 
  - find a simple path starting at  $w$  using all remaining vertices
- Clean up: remove  $v$  from current path.

**Q.** How to implement?

**A.** Add cleanup to DFS (!!)

## Hamilton path: Java implementation

```

public class HamiltonPath
{
    private boolean[] marked; // vertices on current path
    private int count = 0; // number of Hamiltonian paths

    public HamiltonPath(Graph G)
    {
        marked = new boolean[G.V()];
        for (int v = 0; v < G.V(); v++)
            dfs(G, v, 1);
    }

    private void dfs(Graph G, int v, int depth)
    {
        marked[v] = true;
        if (depth == G.V()) count++;

        for (int w : G.adj(v))
            if (!marked[w]) dfs(G, w, depth+1); ← backtrack if w is
                already part of path

        marked[v] = false; ← clean up
    }
}

```

found one →

length of current path  
(depth of recursion)

backtrack if w is already part of path

clean up

## Exhaustive search: summary

problem	enumeration	backtracking
N-rooks	permutations	no
N-queens	permutations	yes
Sudoku	base-9 numbers	yes
scheduling	subsets	yes
Boggle	paths in a grid	yes
Hamilton path	paths in a graph	yes
