

## 4.4 Symbol Tables

---

# Symbol Table

Symbol table. Key-value pair abstraction.

- Insert (or **Put**) a key with specified value.
- Given a key, search for (or **Get**) the corresponding value.

Ex. [DNS lookup]

- Insert URL with specified IP address.
- Given URL, find corresponding IP address.

URL key	IP address value
www.cs.princeton.edu	128.112.136.11
www.princeton.edu	128.112.128.15
www.yale.edu	130.132.143.21
www.harvard.edu	128.103.060.55
www.simpsons.com	209.052.165.60

# Symbol Table Applications

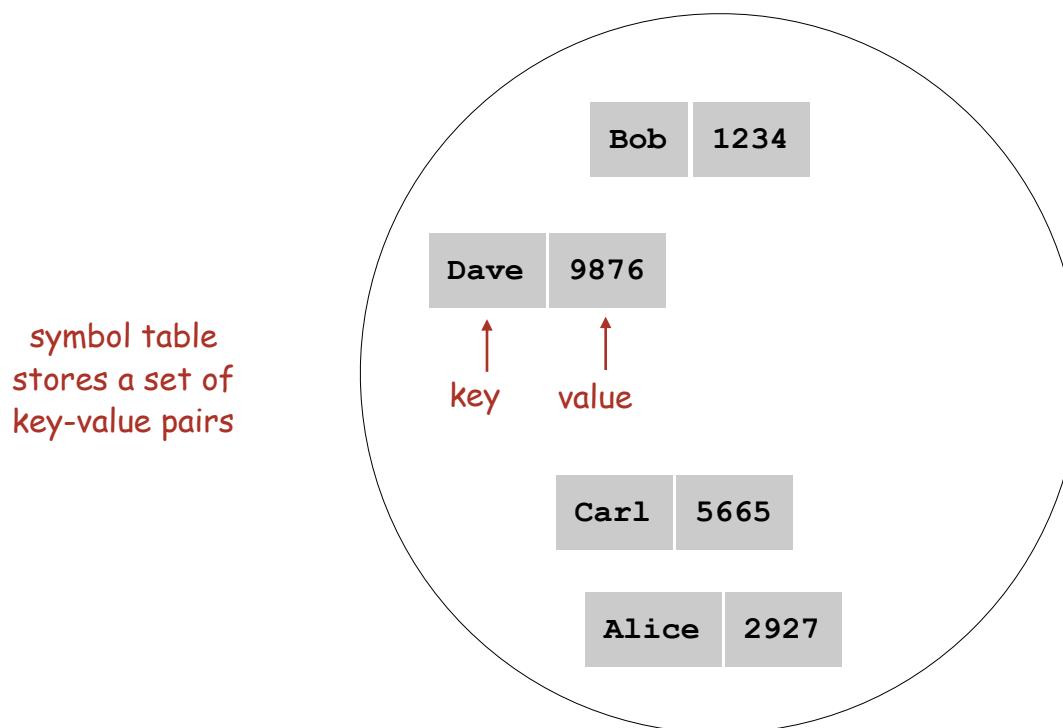

Application	Purpose	Key	Value
phone book	look up phone number	name	phone number
bank	process transaction	account number	transaction details
file share	find song to download	name of song	computer ID
file system	find file on disk	filename	location on disk
dictionary	look up word	word	definition
web search	find relevant documents	keyword	list of documents
book index	find relevant pages	keyword	list of pages
web cache	download	filename	file contents
genomics	find markers	DNA string	known positions
DNS	find IP address given URL	URL	IP address
reverse DNS	find URL given IP address	IP address	URL
compiler	find properties of variable	variable name	value and type
routing table	route Internet packets	destination	best route

# Symbol Table API

```
public class *ST<Key extends Comparable<Key>, Value>
```

*ST()	<i>create a symbol table</i>
void put(Key key, Value v)	<i>put key-value pair into the table</i>
Value get(Key key)	<i>return value paired with key, null if key not in table</i>
boolean contains(Key key)	<i>is there a value paired with key?</i>

*Note: Implementations should also implement the Iterable<Key> interface to enable clients to access keys in sorted order with foreach loops.*

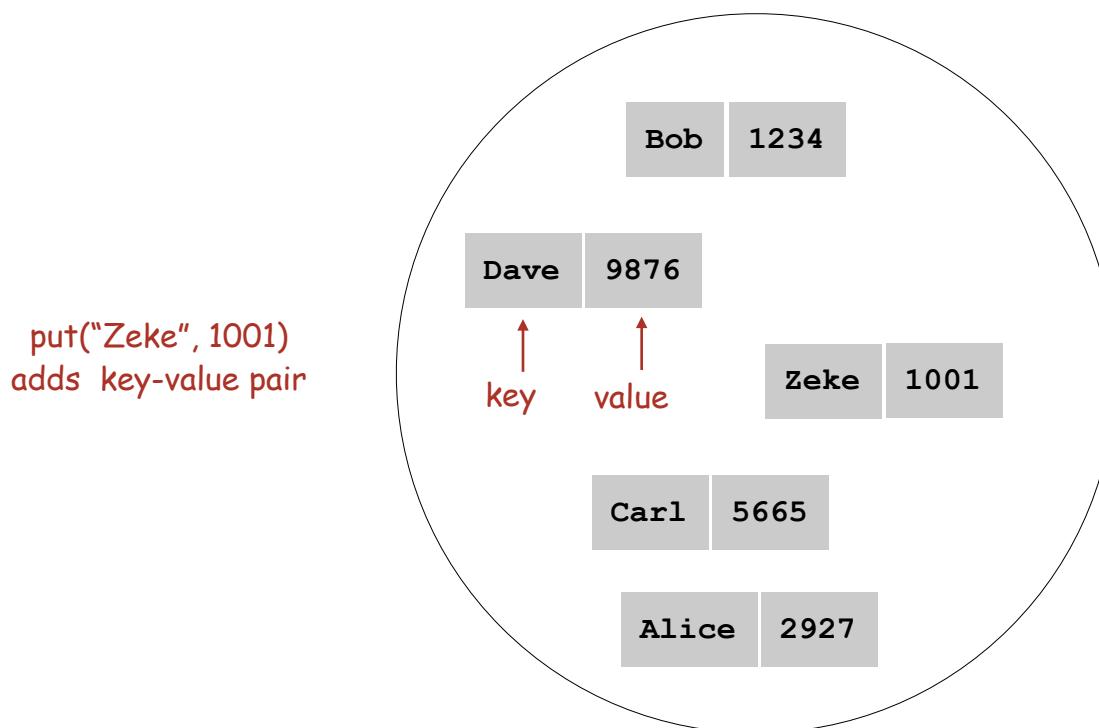

# Symbol Table API

```
public class *ST<Key extends Comparable<Key>, Value>
```

*ST()	<i>create a symbol table</i>
void put(Key key, Value v)	<i>put key-value pair into the table</i>
Value get(Key key)	<i>return value paired with key, null if key not in table</i>
boolean contains(Key key)	<i>is there a value paired with key?</i>

*Note: Implementations should also implement the Iterable<Key> interface to enable clients to access keys in sorted order with foreach loops.*

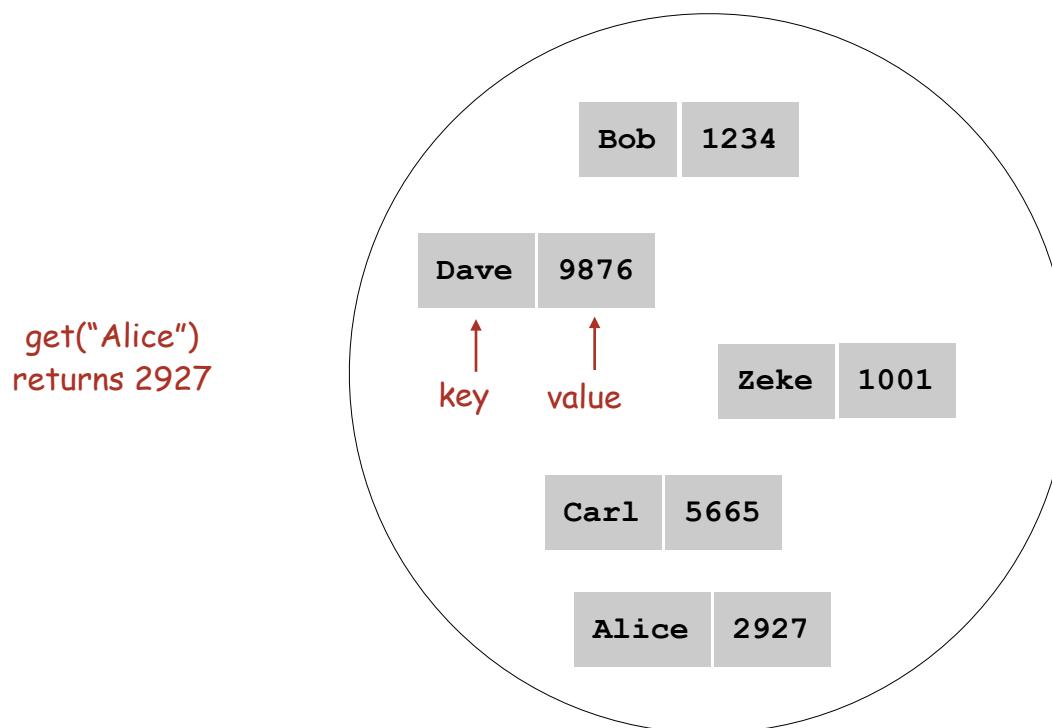

# Symbol Table API

```

void put(Key key, Value v)	<i>put key-value pair into the table</i>
Value get(Key key)	<i>return value paired with key, null if key not in table</i>
boolean contains(Key key)	<i>is there a value paired with key?</i>

*Note: Implementations should also implement the Iterable<Key> interface to enable clients to access keys in sorted order with foreach loops.*

# Symbol Table Sample Client

```
public static void main(String[] args)
{
    ST<String, String> st = new ST<String, String>();

    st.put("www.cs.princeton.edu", "128.112.136.11");
    st.put("www.princeton.edu",      "128.112.128.15");
    st.put("www.yale.edu",          "130.132.143.21");
    st["www.yale.com"] = "209.052.165.60"
    StdOut.println(st.get("www.cs.princeton.edu"));
    StdOut.println(st.get("www.harvardsucks.org"));
    StdOut.println(st.get("www.yale.edu"));
}
```

st["www.yale.edu"]

```
128.112.136.11
null
130.132.143.21
```

## Symbol Table Client: Frequency Counter

Frequency counter. [e.g., web traffic analysis, linguistic analysis]

- Read in a key.
- If key is in symbol table, increment count by one;
- If key is not in symbol table, insert it with count = 1.

```
public class Freq {
    public static void main(String[] args) {           key type   value type
        ST<String, Integer> st = new ST<String, Integer>();      ←           ←

        while (!StdIn.isEmpty()) {
            String key = StdIn.readString();
            if (st.contains(key)) st.put(key, st.get(key) + 1);
            else                  st.put(key, 1);
        }                                calculate frequencies
                                            ←
                                            foreach loop (stay tuned)
                                            ←
                                            for (String s : st)
                                                StdOut.println(st.get(s) + " " + s);      print results
                                            ←
                                            }
}
```

## Sample Datasets

Linguistic analysis. Compute word frequencies in a piece of text.

File	Description	Words	Distinct
<code>mobydick.txt</code>	Melville's Moby Dick	210,028	16,834
<code>leipzig100k.txt</code>	100K random sentences	2,121,054	144,256
<code>leipzig200k.txt</code>	200K random sentences	4,238,435	215,515
<code>leipzig1m.txt</code>	1M random sentences	21,191,455	534,580

## Zipf's Law

Linguistic analysis. Compute word frequencies in a piece of text.

```
% java Freq < moby dick.txt  
4583 a  
2 aback  
2 abaft  
3 abandon  
7 abandoned  
1 abandonedly  
2 abandonment  
2 abased  
1 abasement  
2 abashed  
1 abate  
...
```

```
% java Freq < moby dick.txt | sort -rn  
13967 the  
6415 of  
6247 and  
4583 a  
4508 to  
4037 in  
2911 that  
2481 his  
2370 it  
1940 i  
1793 but  
...
```

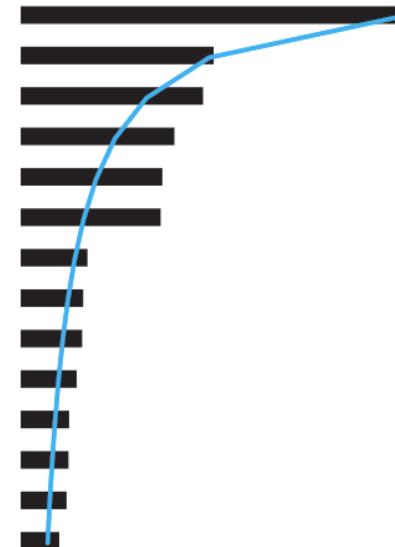

Zipf's law. In natural language, frequency of  $i^{th}$  most common word is inversely proportional to  $i$ .

e.g., most frequent word occurs about twice as often as second most frequent one

# Zipf's Law

Linguistic analysis. Compute word frequencies in a piece of text.

# Symbol Table: Elementary Implementations

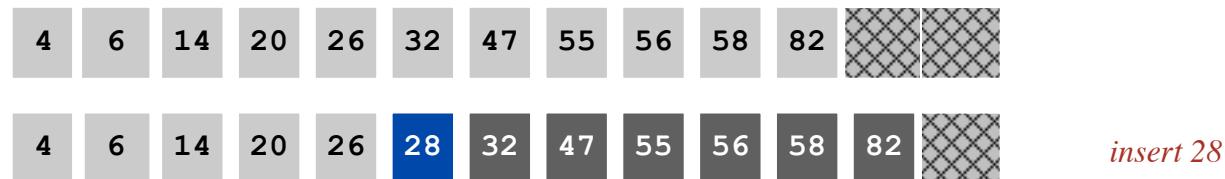

## Unordered array.

- Put: add key to the end (if not already there).
- Get: scan through all keys to find desired value.

## Ordered array.

- Put: find insertion point, and shift all larger keys right.
- Get: binary search to find desired key.

## Binary Search: Mathematical Analysis

**Analysis.** To binary search in an array of size  $N$ : do one compare, then binary search in an array of size  $N / 2$ .

$$N \rightarrow N / 2 \rightarrow N / 4 \rightarrow N / 8 \rightarrow \dots \rightarrow 1$$

**Q.** How many times can you divide a number by 2 until you reach 1?

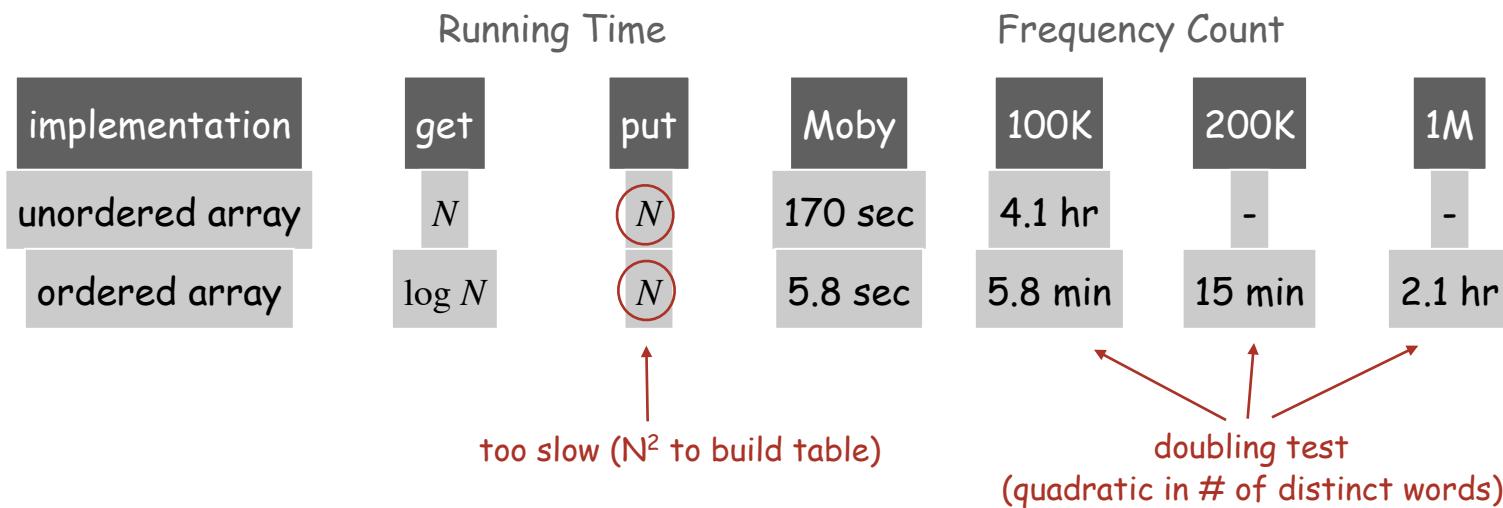

**A.**  $\log_2 N$ .

$$\begin{aligned} & 1 \\ & 2 \rightarrow 1 \\ & 4 \rightarrow 2 \rightarrow 1 \\ & 8 \rightarrow 4 \rightarrow 2 \rightarrow 1 \\ & 16 \rightarrow 8 \rightarrow 4 \rightarrow 2 \rightarrow 1 \\ & 32 \rightarrow 16 \rightarrow 8 \rightarrow 4 \rightarrow 2 \rightarrow 1 \\ & 64 \rightarrow 32 \rightarrow 16 \rightarrow 8 \rightarrow 4 \rightarrow 2 \rightarrow 1 \\ & 128 \rightarrow 64 \rightarrow 32 \rightarrow 16 \rightarrow 8 \rightarrow 4 \rightarrow 2 \rightarrow 1 \\ & 256 \rightarrow 128 \rightarrow 64 \rightarrow 32 \rightarrow 16 \rightarrow 8 \rightarrow 4 \rightarrow 2 \rightarrow 1 \\ & 512 \rightarrow 256 \rightarrow 128 \rightarrow 64 \rightarrow 32 \rightarrow 16 \rightarrow 8 \rightarrow 4 \rightarrow 2 \rightarrow 1 \\ & 1024 \rightarrow 512 \rightarrow 256 \rightarrow 128 \rightarrow 64 \rightarrow 32 \rightarrow 16 \rightarrow 8 \rightarrow 4 \rightarrow 2 \rightarrow 1 \end{aligned}$$

## Symbol Table: Implementations Cost Summary

Unordered array. Hopelessly slow for large inputs.

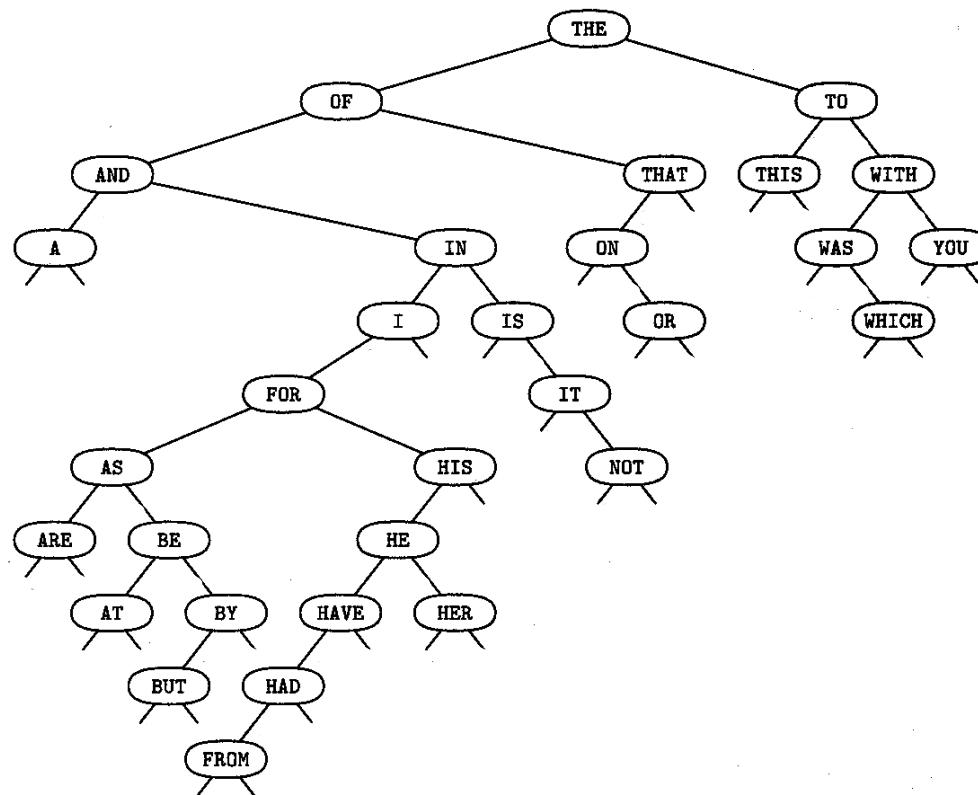

Ordered array. Acceptable if many more searches than inserts;  
too slow if many inserts.

Challenge. Make all ops logarithmic.

# Binary Search Trees

---

Reference: Knuth, The Art of Computer Programming

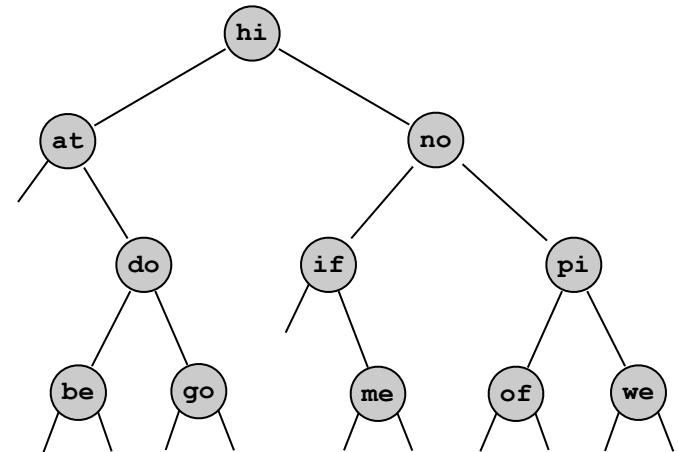

# Binary Search Trees

Def. A binary search tree is a binary tree in symmetric order.

Binary tree is either:

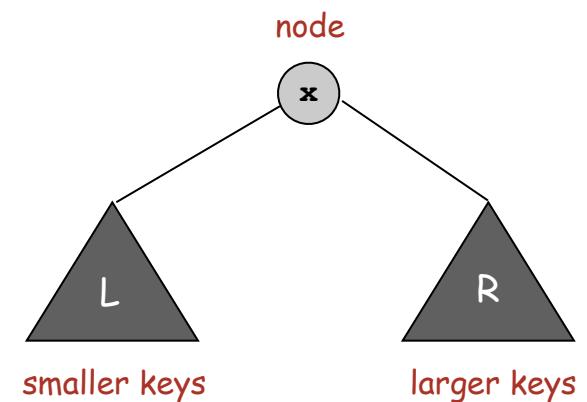

- Empty.
- A key-value pair and two binary trees.

we suppress values from figures

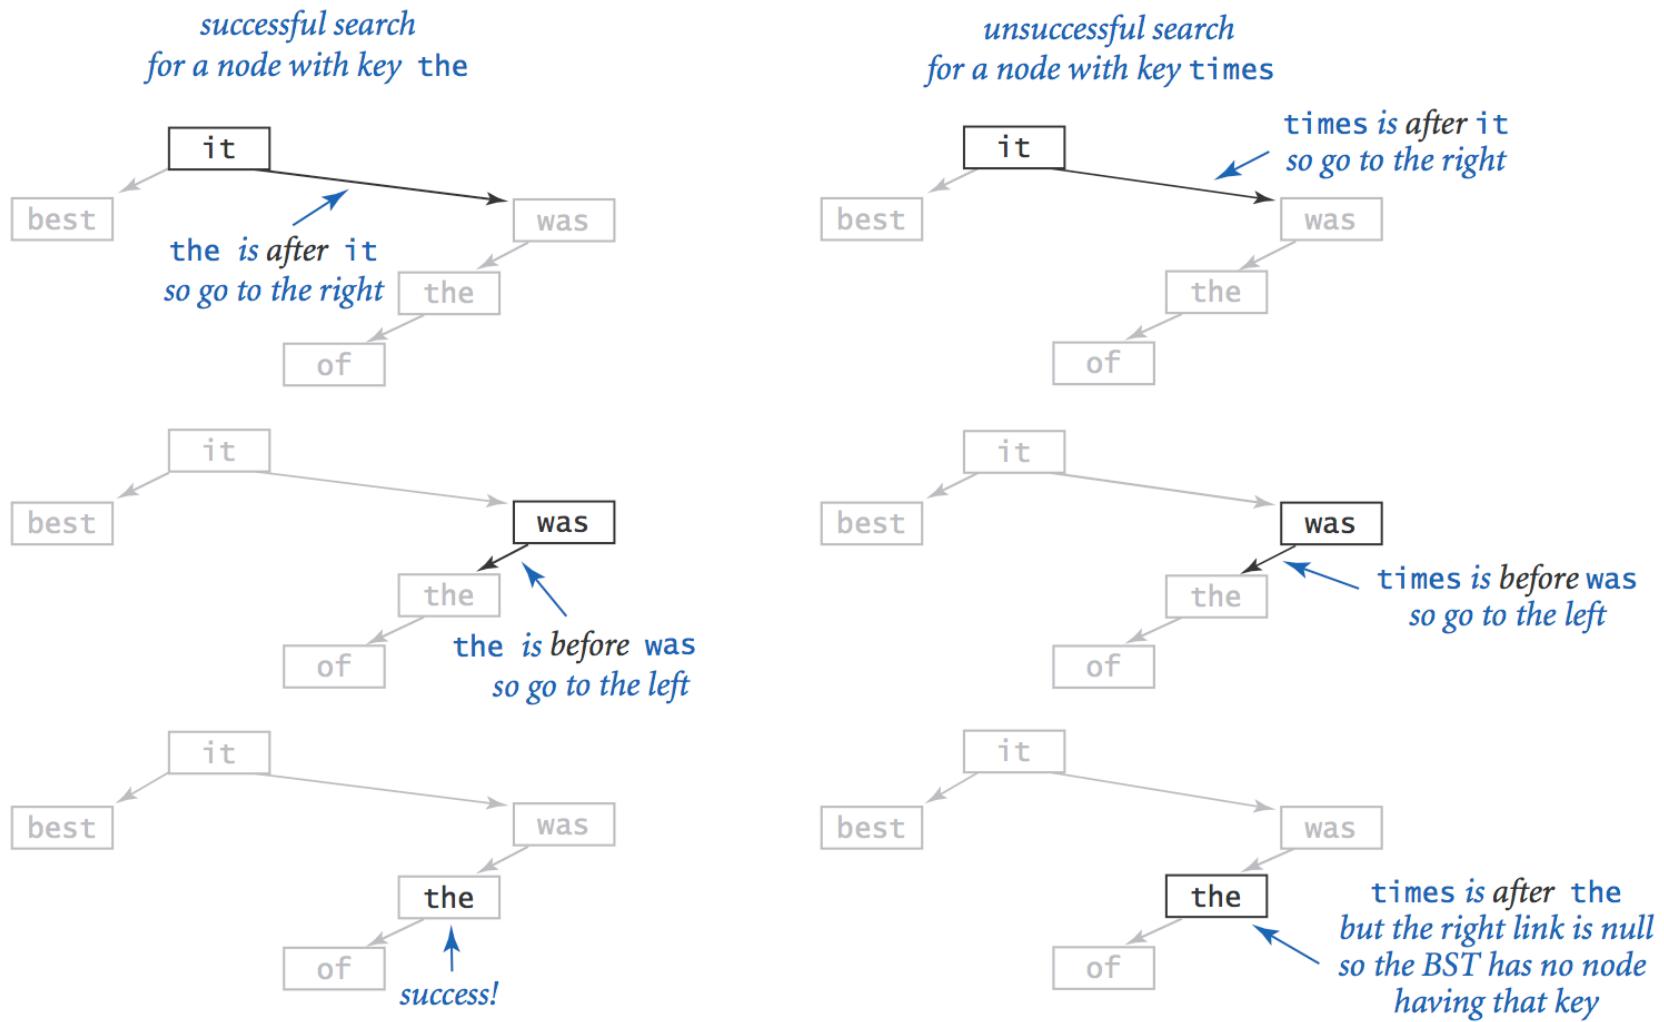

Symmetric order.

- Keys in left subtree are smaller than parent.
- Keys in right subtree are larger than parent.

# Binary Search Tree: Java Implementation

To implement: use **two** links per Node.

A **Node** is comprised of:

- A key.
- A value.
- A reference to the left subtree.
- A reference to the right subtree.

```
private class Node {  
    private Key key;  
    private Value val;  
    private Node left;  
    private Node right;  
}
```

## BST: Skeleton

BST. Allow generic keys and values.

requires `Key` to provide `compareTo()` method;  
see textbook for details

```
public class BST<Key extends Comparable<Key>, Value> {  
    private Node root; // root of the BST  
  
    private class Node {  
        private Key key;  
        private Value val;  
        private Node left, right;  
  
        private Node(Key key, Value val) {  
            this.key = key;  
            this.val = val;  
        }  
    }  
  
    public void put(Key key, Value val) { ... }  
    public Value get(Key key) { ... }  
    public boolean contains(Key key) { ... }  
}
```

## BST: Get (or Search)

Get. Return `val` corresponding to given `key`, or `null` if no such key.

```
public Value get(Key key) {
    return get(root, key);
}

private Value get(Node x, Key key) {
    if (x == null) return null;
    int cmp = key.compareTo(x.key);
    if (cmp < 0) return get(x.left, key);
    else if (cmp > 0) return get(x.right, key);
    else
        return x.val; //found key!
}

public boolean contains(Key key) {
    return (get(key) != null);
}
```

negative if less,  
zero if equal,  
positive if greater

## BST: Put (or Insert)

Put. Associate `val` with `key`.

- Search, then insert.
- Concise (but tricky) recursive code.

```
public void put(Key key, Value val) {
    root = put(root, key, val);
}

private Node put(Node x, Key key, Value val) {
    if (x == null) return new Node(key, val);
    int cmp = key.compareTo(x.key);
    if (cmp < 0) x.left = put(x.left, key, val);
    else if (cmp > 0) x.right = put(x.right, key, val);
    else x.val = val;
    return x;
}
```

↑  
overwrite old value with new value

## BST Implementation: Practice

Bottom line. Difference between a practical solution and no solution.

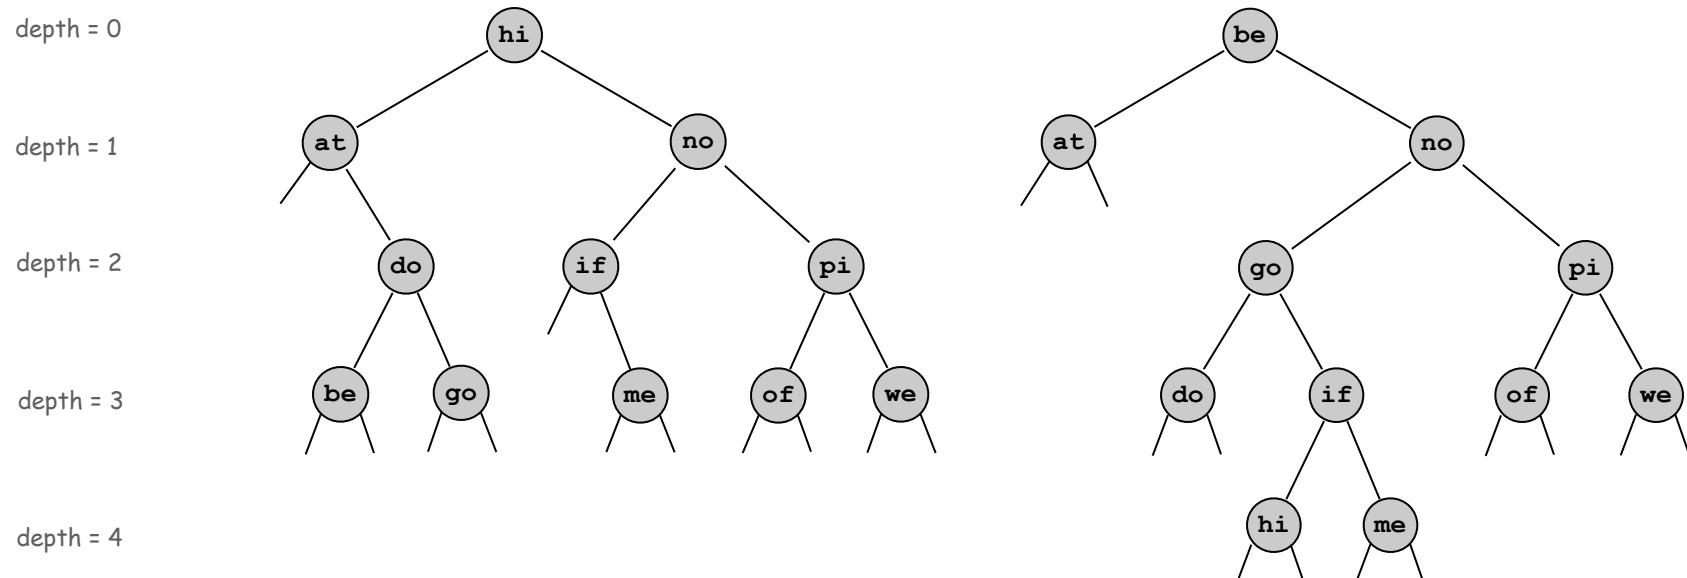

implementation	Running Time			Frequency Count		
	get	put	Moby	100K	200K	1M
unordered array	$N$	$N$	170 sec	4.1 hr	-	-
ordered array	$\log N$	$N$	5.8 sec	5.8 min	15 min	2.1 hr
BST	?	?	.95 sec	7.1 sec	14 sec	69 sec

# BST: Analysis

Running time per put/get.

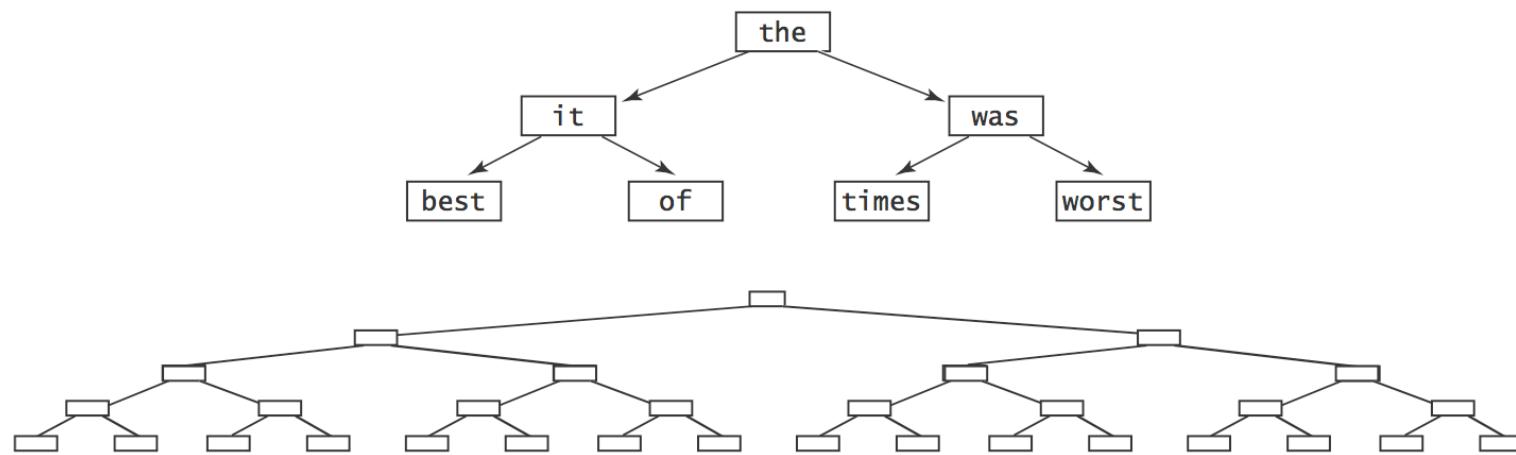

- There are many BSTs that correspond to same set of keys.
- Cost is proportional to **depth** of node.

number of links on path from root to node

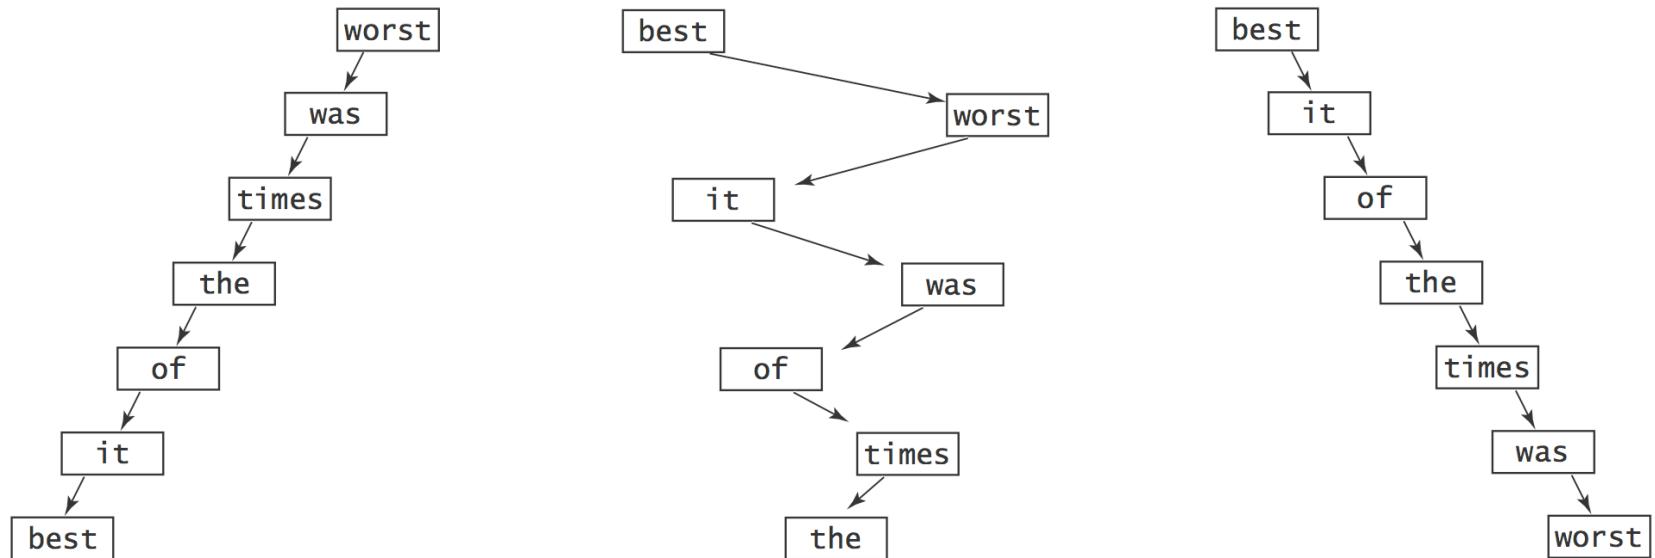

## BST: Analysis

Best case. If tree is perfectly balanced, depth is at most  $\lg N$ .

# BST: Analysis

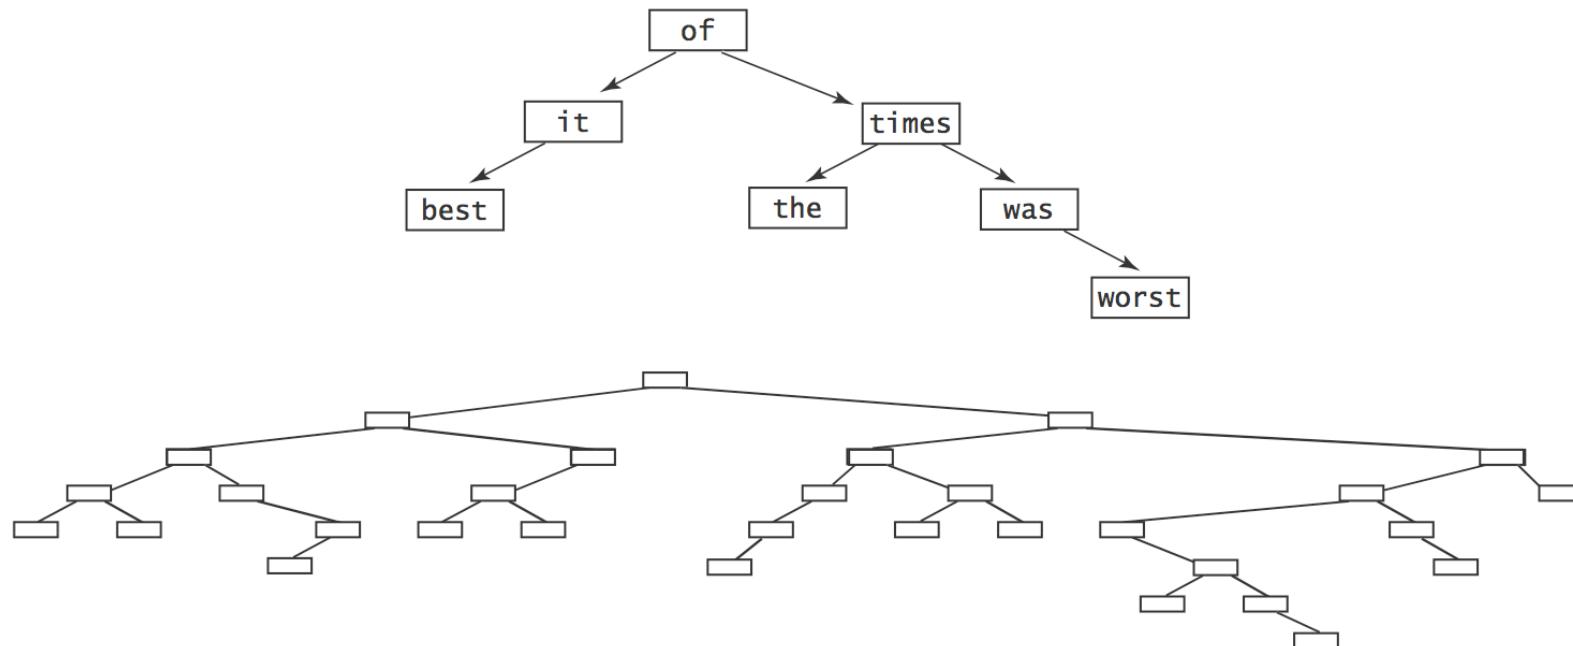

Worst case. If tree is unbalanced, depth can be  $N$ .

## BST: Analysis

Average case. If keys are inserted in random order, trees stay ~flat, and average depth is  $2 \ln N$ .

requires proof  
(see COS 226)

Typical BSTs constructed from randomly ordered keys

## Symbol Table: Implementations Cost Summary

BST. Logarithmic time ops if keys inserted in **random** order.

implementation	Running Time			Frequency Count		
	get	put	Moby	100K	200K	1M
unordered array	$N$	$N$	170 sec	4.1 hr	-	-
ordered array	$\log N$	$N$	5.8 sec	5.8 min	15 min	2.1 hr
BST	$\log N^\dagger$	$\log N^\dagger$	.95 sec	7.1 sec	14 sec	69 sec

† assumes keys inserted in random order

Q. Can we guarantee logarithmic performance?

# Red-Black Tree

Red-black tree. A clever BST variant that *guarantees* depth  $\leq 2 \lg N$ .

see COS 226

```
import java.util.TreeMap;
import java.util.Iterator;

public class ST<Key extends Comparable<Key>, Value> implements Iterable<Key> {
    private TreeMap<Key, Value> st = new TreeMap<Key, Val>();

    public void put(Key key, Value val) {
        if (val == null) st.remove(key);
        else st.put(key, val);
    }

    public Value get(Key key) { return st.get(key); }

    public Value remove(Key key) { return st.remove(key); }

    public boolean contains(Key key) { return st.containsKey(key); }

    public Iterator<Key> iterator() { return st.keySet().iterator(); }
}
```

Java red-black tree library implementation

# Red-Black Tree

Red-Black Tree. A clever BST variant that *guarantees* depth  $\leq 2 \lg N$

↑  
see COS 226

implementation	Running Time			Frequency Count		
	get	put	Moby	100K	200K	1M
unordered array	$N$	$N$	170 sec	4.1 hr	-	-
ordered array	$\log N$	$N$	5.8 sec	5.8 min	15 min	2.1 hr
BST	$\log N^\dagger$	$\log N^\dagger$	.95 sec	7.1 sec	14 sec	69 sec
red-black	$\log N$	$\log N$	.95 sec	7.0 sec	14 sec	74 sec

† assumes keys inserted in random order

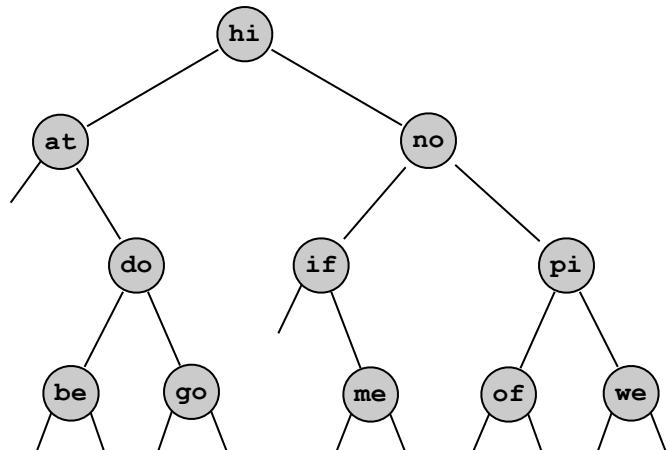

# Iteration

---

## Inorder Traversal

Inorder traversal.

- Recursively visit left subtree.
- Visit node.
- Recursively visit right subtree.

inorder: at be do go hi if me no of pi we

```
public inorder() { inorder(root); }

private void inorder(Node x) {
    if (x == null) return;
    inorder(x.left);
    StdOut.println(x.key);
    inorder(x.right);
}
```

## Enhanced For Loop

Enhanced for loop. Enable client to iterate over items in a collection.

```
ST<String, Integer> st = new ST<String, Integer>();  
...  
  
for (String s : st) {  
    StdOut.println(st.get(s) + " " + s);  
}
```

# Enhanced For Loop with BST

BST. Add following code to support enhanced for loop.

see COS 226 for details

```
import java.util.Iterator;
import java.util.NoSuchElementException;

public class BST<Key extends Comparable<Key>, Value> implements Iterable<Key> {
    private Node root;
    private class Node { ... }
    public void put(Key key, Value val) { ... }
    public Value get(Key key) { ... }
    public boolean contains(Key key) { ... }

    public Iterator<Key> iterator() { return new Inorder(); }
    private class Inorder implements Iterator<Key> {
        Inorder() { pushLeft(root); }
        public void remove() { throw new UnsupportedOperationException(); }
        public boolean hasNext() { return !stack.isEmpty(); }
        public Key next() {
            if (!hasNext()) throw new NoSuchElementException();
            Node x = stack.pop();
            pushLeft(x.right);
            return x.key;
        }
        public void pushLeft(Node x) {
            while (x != null) {
                stack.push(x);
                x = x.left;
            }
        }
    }
}
```

## Symbol Table: Summary

Symbol table. Quintessential database lookup data type.

Choices. Ordered array, unordered array, BST, red-black, hash, ....

- Different performance characteristics.
- Java libraries: `TreeMap`, `HashMap`.

Remark. Better symbol table implementation improves all clients.

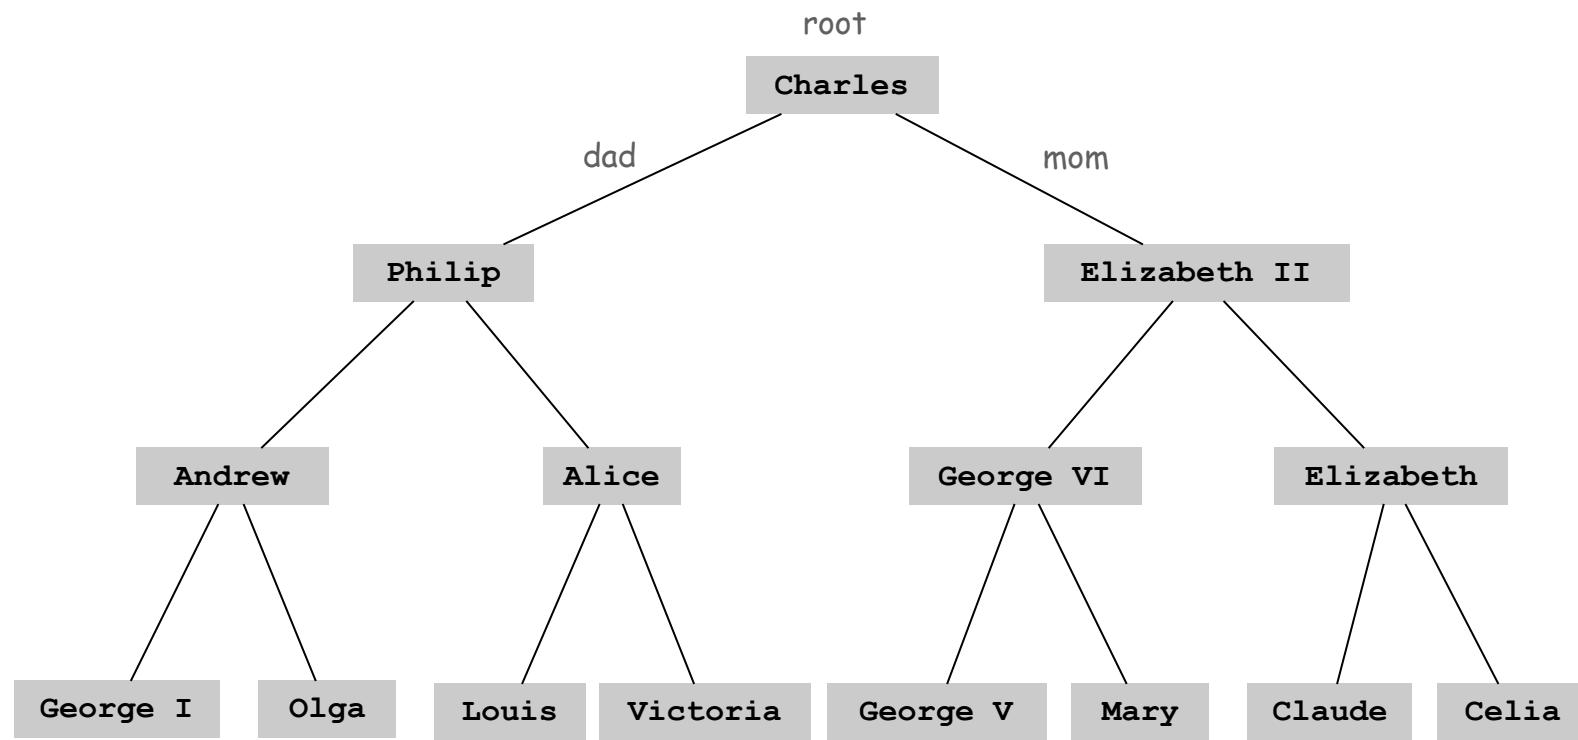

# Other Types of Trees
