# Lighting and Reflectance 

## COS 426, Spring 2014

Princeton University

## Ray Casting

> R2Image *RayCast(R3Scene *scene, int width, int height)
\{
R2Image *image = new R2Image( width, height); for (int i = 0; i < width; i++) \{ for (int $\mathrm{j}=0 ; \mathrm{j}<$ height $\mathrm{j}++$ ) $\{$ R3Ray ray $=$ ConstructRayThroughPixel(scene->camera, $\mathrm{i}, \mathrm{j}$ ); R3Rgb radiance = ComputeRadiance(scene, \&ray); image->SetPixel(i, j, radiance);
\}
\}
return image;
\}

Without Illumination

## Ray Casting

R3Rgb ComputeRadiance(R3Scene *scene, R3Ray *ray)
\{
R3Intersection intersection = ComputeIntersection(scene, ray); return ComputeRadiance(scene, ray, intersection);
\}

With Illumination

## Illumination

- How do we compute radiance for a sample ray once we know what it hits?

ComputeRadiance(scene, ray, intersection)

## Goal

- Must derive computer models for ...
- Emission at light sources
- Scattering at surfaces
- Reception at the camera
- Desirable features ...
- Concise
- Efficient to compute - "Accurate"

## Overview

- Direct Illumination
- Emission at light sources
- Scattering at surfaces
- Global illumination
- Shadows
- Refractions
- Inter-object reflections

Direct Illumination

## Emission at Light Sources

- $I_{L}(x, y, z, \theta, \phi, \lambda) \ldots$
- describes the intensity of energy,
- leaving a light source, ...
- arriving at location(x,y,z), ...
- from direction $(\theta, \phi), \ldots$
- with wavelength $\lambda$

Light

## Empirical Models

- Ideally measure irradiant energy for "all" situations
- Too much storage
- Difficult in practice

## OpenGL Light Source Models

- Simple mathematical models:
- Point light
- Spot light
- Directional light

## Point Light Source

- Models omni-directional point source
- intensity ( $l_{0}$ ),
- position ( $p_{x}, p_{y}, p_{z}$ ),
- coefficients $\left(c_{a}, l_{a}, q_{a}\right)$ for attenuation with distance (d)

## Point Light Source

$$
I_{L}=\frac{\mathrm{I}_{0}}{c_{a}+l_{a} d+q_{a} d^{2}}
$$

- Physically-based: "inverse square law"
- $c_{a}=l_{a}=0$
- Use $c_{a}$ and $l_{a} \neq 0$ for (non-physical) artistic effects

## Directional Light Source

- Models point light source at infinity
- intensity $\left(I_{0}\right)$,
- direction $\left(\mathrm{d}_{\mathrm{x}}, \mathrm{d}_{\mathrm{y}}, \mathrm{d}_{\mathrm{z}}\right)$

No attenuation with distance

$$
I_{L}=I_{0}
$$

## Spot Light Source

- Models point light source with direction
- intensity ( $\mathrm{I}_{0}$ ),
- position ( $p_{x}, p_{y}, p_{z}$ ),
- direction ( $d_{x}, d_{y}, d_{z}$ )
- attenuation with distance
- falloff (sd), and cutoff (sc)

$$
\begin{array}{ll}
\left(\mathrm{p}_{\mathrm{x}}, \mathrm{p}_{\mathrm{y}}, \mathrm{p}_{2}\right) & \Theta=\cos ^{-1}(\mathrm{~L} \cdot \mathrm{D}) \\
I_{L}=\left\{\begin{array}{cl}
\frac{\mathrm{I}_{0}(\cos \Theta)^{s d}}{c_{a}+l_{a} d+q_{a} d^{2}} & \text { if } \Theta \leq s c, \\
0 & \text { otherwise }
\end{array}\right.
\end{array}
$$

## Overview

- Direct Illumination
- Emission at light sources
- Scattering at surfaces
- Global illumination
- Shadows
- Refractions
- Inter-object reflections

Direct Illumination

## Scattering at Surfaces

Bidirectional Reflectance Distribution Function $\mathrm{f}_{\mathrm{r}}\left(\theta_{i}, \phi_{i}, \theta_{0}, \phi_{0}, \lambda\right) \ldots$

- describes the aggregate fraction of incident energy,
- arriving from direction $\left(\theta_{i}, \phi_{i}\right), \ldots$
- leaving in direction $\left(\theta_{0}, \phi_{0}\right), \ldots$
- with wavelength $\lambda$

Surface

## Empirical Models

Ideally measure BRDF for "all" combinations of angles: $\theta_{i}, \phi_{i}, \theta_{0}, \phi_{o}$

- Difficult in practice
- Too much storage

## Parametric Models

Approximate BRDF with simple parametric function that is fast to compute.

- Phong [75]
- Blinn-Phong [77]
- Cook-Torrance [81]
- He et al. [91]
- Ward [92]
- Lafortune et al. [97]
- Ashikhmin et al. [00]
- etc.

## OpenGL Reflectance Model

- Simple analytic model:
- diffuse reflection +
- specular reflection +
- emission +
- "ambient"

## Based on model proposed by Phong

Surface

## OpenGL Reflectance Model

- Simple analytic model:
- diffuse reflection +
- specular reflection +
- emission +
- "ambient"

## Based on model proposed by Phong

Surface

## Diffuse Reflection

- Assume surface reflects equally in all directions
- Examples: chalk, clay

## Diffuse Reflection

- What is brightness of surface?
- Depends on angle of incident light

Surface

## Diffuse Reflection

- What is brightness of surface?
- Depends on angle of incident light

$$
d L=d A \cos \Theta
$$

Surface

## Diffuse Reflection

- Lambertian model
- cosine law (dot product)

## OpenGL Reflectance Model

- Simple analytic model:
- diffuse reflection +
- specular reflection +
- emission +
- "ambient"

Surface

## Specular Reflection

- Reflection is strongest near mirror angle
- Examples: mirrors, metals

## Specular Reflection

How much light is seen?
Depends on:

- angle of incident light
- angle to viewer

Viewer

## Specular Reflection

- Phong Model
- $(\cos \alpha)^{n}$ This is a (vaguely physically-motivated) hack!

## OpenGL Reflectance Model

- Simple analytic model:
- diffuse reflection +
- specular reflection +
- emission +
- "ambient"

Surface

## Emission

Represents light emanating directly from surface

- Note: does not automatically act as light source! Does not affect other surfaces in scene!

## OpenGL Reflectance Model

- Simple analytic model:
- diffuse reflection +
- specular reflection +
- emission +
- "ambient"

Surface

## Ambient Term

Represents reflection of all indirect illumination

This is a hack (avoids complexity of global illumination)!

## OpenGL Reflectance Model

- Simple analytic model:
- diffuse reflection +
- specular reflection +
- emission +
- "ambient"

Surface

## OpenGL Reflectance Model

- Simple analytic model:
- diffuse reflection +
- specular reflection +
- emission +
- "ambient"

## OpenGL Reflectance Model

Sum diffuse, specular, emission, and ambient

| Phong | $\rho_{\text {ambient }}$ | $\rho_{\text {diffuse }}$ | $\rho_{\text {specular }}$ | $\rho_{\text {total }}$ |
| :--- | :--- | :---: | :---: | :---: |
| $\phi_{i}=60^{\circ}$ |  |  |  |  |
| $\phi_{i}=25^{\circ}$ |  |  |  |  |
|  |  |  |  |  |
| $\phi_{i}=0^{\circ}$ |  |  |  |  |

## OpenGL Reflectance Model

Good model for plastic surfaces, ...

## Direct Illumination Calculation

Single light source:

## Direct Illumination Calculation

Multiple light sources:

## Overview

- Direct Illumination
- Emission at light sources
- Scattering at surfaces
- Global illumination
- Shadows
- Transmissions
- Inter-object reflections

Global Illumination

## Global Illumination

## Ray Casting (last lecture)

Trace primary rays from camera

- Direct illumination from unblocked lights only

Light 2

$$
I=I_{E}+K_{A} I_{A L}+\sum_{L}\left(K_{D}\left(N \cdot L_{i}\right)+K_{S}\left(V \cdot R_{i}\right)^{n}\right) I_{L}
$$

## Shadows

Shadow term tells if light sources are blocked

- Cast ray towards each light source
- $S_{L}=0$ if ray is blocked, $S_{L}=1$ otherwise

## Recursive Ray Tracing

Also trace secondary rays from hit surfaces

- Mirror reflection and transparency

## Mirror reflections

Trace secondary ray in mirror direction

- Evaluate radiance along secondary ray and include it into illumination model

## Transparency

Trace secondary ray in direction of refraction

- Evaluate radiance along secondary ray and include it into illumination model

Radiance for refraction ray

Light 2

$$
I=I_{E}+K_{A} I_{A L}+\sum_{L}\left(K_{D}\left(N \cdot L_{i}\right)+K_{S}\left(V \cdot R_{i}\right)^{n}\right) S_{L} I_{L}+K_{S} I_{R}+K_{T} I_{T}
$$

## Transparency

Transparency coefficient is fraction transmitted

- $\mathrm{K}_{\mathrm{T}}=1$ for translucent object, $\mathrm{K}_{\mathrm{T}}=0$ for opaque
- $0<K_{T}<1$ for object that is semi-translucent

Transparency
Coefficient

Light 2

$$
I=I_{E}+K_{A} I_{A L}+\sum_{L}\left(K_{D}\left(N \cdot L_{i}\right)+K_{S}\left(V \cdot R_{i}\right)^{n}\right) S_{L} I_{L}+K_{S} I_{R}+K_{T} I_{T}
$$

## Refractive Transparency

For thin surfaces, can ignore change in direction

- Assume light travels straight through surface

## Refractive Tranparency

For solid objects, apply Snell's law:
$\eta_{r} \sin \Theta_{r}=\eta_{i} \sin \Theta_{i}$

## Recursive Ray Tracing

## Ray tree represents illumination computation

Ray traced through scene

Ray tree

$$
I=I_{E}+K_{A} I_{A L}+\sum_{L}\left(K_{D}\left(N \cdot L_{i}\right)+K_{S}\left(V \cdot R_{i}\right)^{n}\right) S_{L} I_{L}+K_{S} I_{R}+K_{T} I_{T}
$$

## Recursive Ray Tracing

Ray tree represents illumination computation

Ray traced through scene

Ray tree

$$
I=I_{E}+K_{A} I_{A L}+\sum_{L}\left(K_{D}\left(N \cdot L_{i}\right)+K_{S}\left(V \cdot R_{i}\right)^{n}\right) S_{L} I_{L}+K_{S} I_{R}+K_{T} I_{T}
$$

## Recursive Ray Tracing

## ComputeRadiance is called recursively

R3Rgb ComputeRadiance(R3Scene *scene, R3Ray *ray, R3Intersection\& hit) \{

R3Ray specular_ray = SpecularRay(ray, hit);
R3Ray refractive_ray = RefractiveRay(ray, hit);
R3Rgb radiance $=$ Phong(scene, ray, hit) +
Ks * ComputeRadiance(scene, specular_ray) +
Kt * ComputeRadiance(scene, refractive_ray);
return radiance;

## Example

Turner Whitted, 1980

## Summary

- Ray casting (direct Illumination)
- Usually use simple analytic approximations for light source emission and surface reflectance
- Recursive ray tracing (global illumination)
- Incorporate shadows, mirror reflections, and pure refractions

## All of this is an approximation so that it is practical to compute

More on global illumination next time!

## Illumination Terminology

- Radiant power [flux] ( $\Phi$ )
- Rate at which light energy is transmitted (in Watts).
- Radiant Intensity (I)
- Power radiated onto a unit solid angle in direction (in Watts/sr) " e.g.: energy distribution of a light source (inverse square law)
- Radiance (L)
- Radiant intensity per unit projected surface area (in Watts/m²sr) " e.g.: light carried by a single ray (no inverse square law)
- Irradiance (E)
- Incident flux density on a locally planar area (in Watts/m²)
" e.g.: light hitting a surface at a point
- Radiosity (B)
- Exitant flux density from a locally planar area (in Watts $/ \mathrm{m}^{2}$ )
