Instructions. This exam has 7 questions, worth 10 points each. You have 50 minutes.

Resources. You may reference your optional one-sided 8.5-by-11 handwritten "cheat sheet" during this exam. You may not use the textbook, your notes, or any electronic devices. You may not communicate with anyone except the course staff during this exam.

Discussing this exam. Due to travel for extracurriculars and sports, some of your peers will take this exam next week. Do not discuss its contents with anyone who has not taken it.

This paper. Do not remove this exam from the exam room. You may fill in this page now.

What do the following Java expressions evaluate to? If an expression does not compile or causes an exception at runtime, put an X in both columns.

<table>
<thead>
<tr>
<th>Expression</th>
<th>Value</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;1&quot; + 2 * 6</td>
<td>“112”</td>
<td>String</td>

</tbody>
</table>

A. int  
B. double  
C. short  
D. long  
E. float  
F. curly braces  
G. square brackets  
H. parentheses  
I. for loop  
J. while loop  
K. statement  
L. signature  
M. semicolon  
N. public  
O. private  
P. void  
Q. null  
R. default  
S. static  
T. break  
U. return  
V. true  
W. false  
X. StackOverflowError  
Y. infinite loop  
Z. compilation error
Next to each piece of code, either mark the kind of error, or mark "no error" and write what is printed.

**Assume that:** boolean A = false; boolean B = true; boolean C = false;

1. if (A) StdOut.println("A");
   else StdOut.println("B");
   - no error; the output is: **B**

2. if (A == true); StdOut.println("A");
   - runtime error or infinite loop
   - no error; the output is: **A**

3. while (A == false) {
      if (B == false) A = false;
      if (C == false) B = false;
   } StdOut.println(B);
   - runtime error or infinite loop
   - no error; the output is: ________

**NOTE:** The variables A, B, and C are reset to their original values before running the code below.

4. for (int i = 0; i < 100; i++) {
      boolean temp = A;
      A = B;
      B = temp;
   }
   StdOut.println(A);
   - no error; the output is: **false**

5. for (boolean D = true; C == D;)
      D = false;
   StdOut.println(D);
   - compilation error
   - no error; the output is: ________
<table>

<td>false</td>
</tr>
</tbody>
</table>
What do each of the following functions return? Fill in the tables below.

Assume that the arrays \( x, y, \) and \( z \) are defined as follows:
\[
\text{int[]} \ x = \text{new int}[5]; \ \text{int[]} \ y = \{1, 2, 6\}; \ \text{int[]} \ z = \{-10, 0, 10\};
\]

```java
public static int f(int[] a) {
    int t = 0;
    int n = a.length;
    for (int i = 0; i < n; i++)
        t += a[i];
    return t;
}
```

<table>
<thead>
<tr>
<th>( f(x) )</th>
<th>( f(y) )</th>
<th>( f(z) )</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>9</td>
<td>0</td>
</tr>
</tbody>
</table>

```java
public static int g(int[] a) {
    int n = a.length;
    for (int i = 0; i < n; i++)
        a[i] = a[n-i-1];
    return f(a);
}
```

<table>
<thead>
<tr>
<th>( g(x) )</th>
<th>( g(y) )</th>
<th>( g(z) )</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>14</td>
<td>20</td>
</tr>
</tbody>
</table>

**NOTE:** The arrays \( x, y, \) and \( z \) are reset to their original values before calling \( h() \).

```java
public static int h(int[] a) {
    int n = a.length;
    for (int i = 0; i < n; i++)
        a[i] = f(a);
    return f(a);
}
```

<table>
<thead>
<tr>
<th>( h(x) )</th>
<th>( h(y) )</th>
<th>( h(z) )</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>58</td>
<td>30</td>
</tr>
</tbody>
</table>
Consider the following program.

```java
public class WordSmith {
    public static String choose(String str1, String str2) {
        // the .length() method returns the number of characters in a String
        if (str1.length() > str2.length())
            return str1;
        return str2;
    }
    public static void main(String[] args) {
        while (!StdIn.isEmpty()) {
            String word1 = StdIn.readString();
            String word2 = StdIn.readString();
            StdOut.print(choose(word1, word2) + " ");
        }
    }
}
```

The file `michelle.txt` contains the following quote:

```
It was clear to me that if I could get through Princeton at the top of my class, I could do anything in the world. -- Michelle Obama
```

What is printed when the user runs the following commands?

```
% java-introcs WordSmith < michelle.txt
was clear that if could Princeton the top class, could anything the world. Michelle
```

```
% java-introcs WordSmith < michelle.txt | java-introcs WordSmith
clear that Princeton top class, anything Michelle
```
This program produces the circles in the image below. Which circle is drawn first? Which is second? In each blank square, write the order the circles will appear. Use each number, 1 to 7, exactly once.

```java
public class Circular {
    public static void horiz(int n, double x, double y, double r) {
        if (n == 0) return;
        vert(n - 1, x + r/2, y, r/2); // recur right
        vert(n - 1, x - r/2, y, r/2); // recur left
        StdDraw.circle(x, y, r);
    }
    public static void vert(int n, double x, double y, double r) {
        if (n == 0) return;
        horiz(n - 1, x, y + r/2, r/2); // recur up
        StdDraw.circle(x, y, r);
        horiz(n - 1, x, y - r/2, r/2); // recur down
    }
    public static void main(String[] args) {
        vert(3, .5, .5, .5);
    }
}
```
