

## Lighting and Reflectance

COS 426, Spring 2018
Princeton University

## Ray Casting

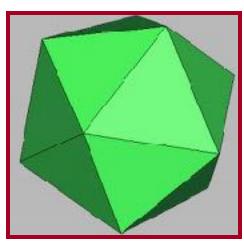

```
R2Image *RayCast(R3Scene *scene, int width, int height)
    R2Image *image = new R2Image(width, height);
    for (int i = 0; i < width; i++) {
        for (int j = 0; j < \text{height}; j++) {
             R3Ray ray = ConstructRayThroughPixel(scene->camera, i, j);
             R3Rgb radiance = ComputeRadiance(scene, &ray);
             image->SetPixel(i, j, radiance);
    return image;
```

Without Illumination

## **Ray Casting**

```
R3Rgb ComputeRadiance(R3Scene *scene, R3Ray *ray)
{
    R3Intersection intersection = ComputeIntersection(scene, ray);
    return ComputeRadiance(scene, ray, intersection);
}
```

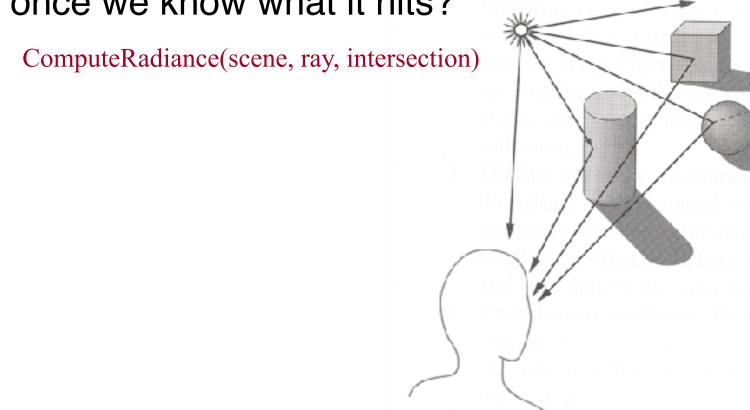

With Illumination

#### Illumination

How do we compute radiance for a sample ray once we know what it hits?

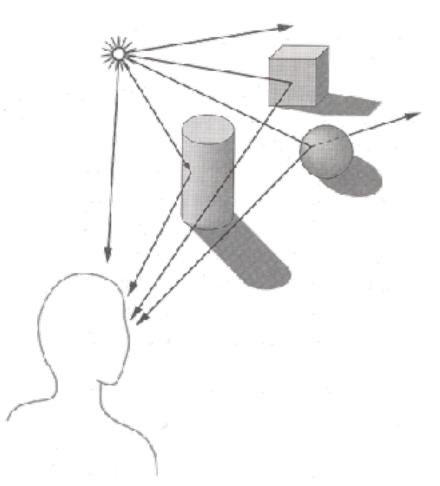

#### Goal

- Must derive computer models for ...
  - Emission at light sources
  - Scattering at surfaces
  - Reception at the camera

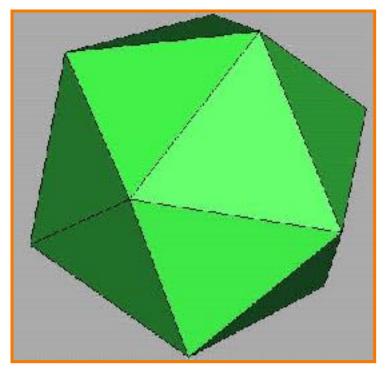

- Desirable features ...
  - Concise
  - Efficient to compute
  - "Accurate"

#### **Overview**

- Direct Illumination
  - Emission at light sources
  - Scattering at surfaces
- Global illumination
  - Shadows
  - Refractions
  - Inter-object reflections

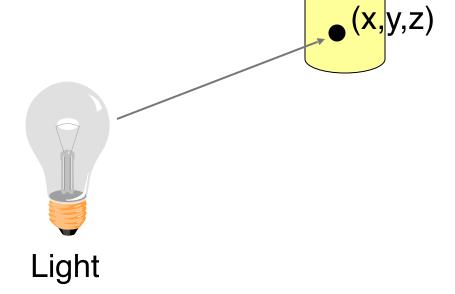

**Direct Illumination** 

## **Emission at Light Sources**

- $I_1(x,y,z,\theta,\phi,\lambda)$  ...
  - describes the intensity of energy,
  - leaving a light source, ...
  - arriving at location(x,y,z), ...
  - from direction  $(\theta,\phi)$ , ...
  - with wavelength λ

## **Empirical Models**

- Ideally measure irradiant energy for "all" situations
  - Too much storage

## **OpenGL Light Source Models**

- Simple mathematical models:
  - Point light
  - Directional light
  - Spot light

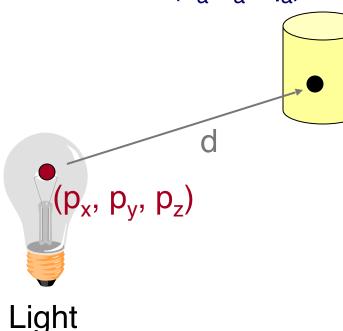

## **Point Light Source**

- Models omni-directional point source
  - intensity (I<sub>0</sub>),
  - position (p<sub>x</sub>, p<sub>y</sub>, p<sub>z</sub>),
  - coefficients (c<sub>a</sub>, l<sub>a</sub>, q<sub>a</sub>) for attenuation with distance (d)

$$I_L = \frac{I_0}{c_a + l_a d + q_a d^2}$$

## **Point Light Source**

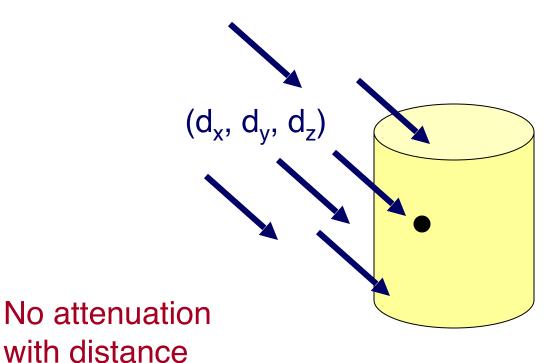

$$I_{L} = \frac{I_{0}}{c_{a} + l_{a}d + q_{a}d^{2}}$$

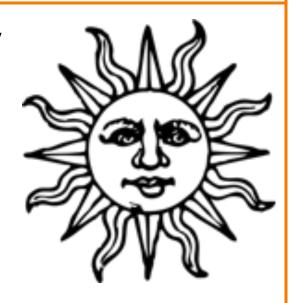

- Physically-based: "inverse square law"
  - $c_a = l_a = 0$
- Use  $c_a$  and  $l_a \neq 0$  for non-physical effects
  - Better control of the look (artistic)

## **Directional Light Source**

- Models point light source at infinity
  - intensity (I<sub>0</sub>),
  - direction (d<sub>x</sub>,d<sub>y</sub>,d<sub>z</sub>)

 $I_L = I_0$ 

## **Spot Light Source**

- Models point light source with direction
  - intensity (I<sub>0</sub>),
  - position (p<sub>x</sub>, p<sub>y</sub>, p<sub>z</sub>),
  - direction (d<sub>x</sub>, d<sub>v</sub>, d<sub>z</sub>)
  - attenuation with distance
  - falloff (sd), and cutoff (sc)

$$(p_x, p_y, p_z)$$

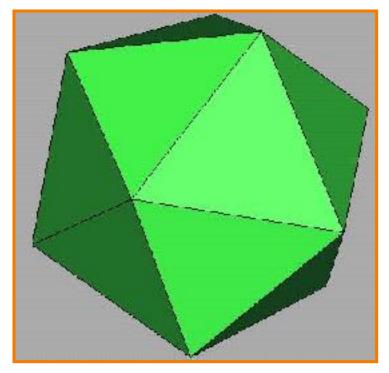

$$\Theta = \cos^{-1}(L \cdot D)$$

$$I_{L} = \begin{cases} \frac{I_{0}(\cos\Theta)^{sd}}{c_{a} + l_{a}d + q_{a}d^{2}} & \text{if } \Theta \leq sc, \\ 0 & \text{otherwise} \end{cases}$$

#### **Overview**

- Direct Illumination
  - Emission at light sources
  - Scattering at surfaces
- Global illumination
  - Shadows
  - Refractions
  - Inter-object reflections

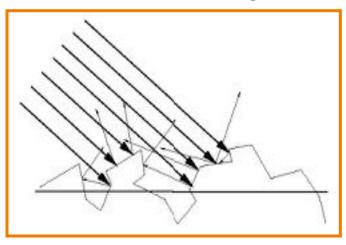

**Direct Illumination** 

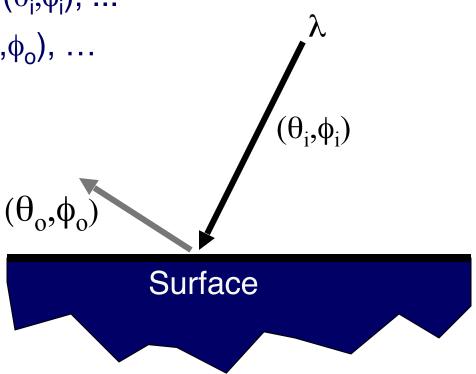

## **Scattering at Surfaces**

# Bidirectional Reflectance Distribution Function $f_r(\theta_i, \phi_i, \theta_o, \phi_o, \lambda)$ ...

- describes the aggregate fraction of incident energy,
- arriving from direction  $(\theta_i, \phi_i)$ , ...
- leaving in direction  $(\theta_o, \phi_o)$ , ...
- with wavelength λ

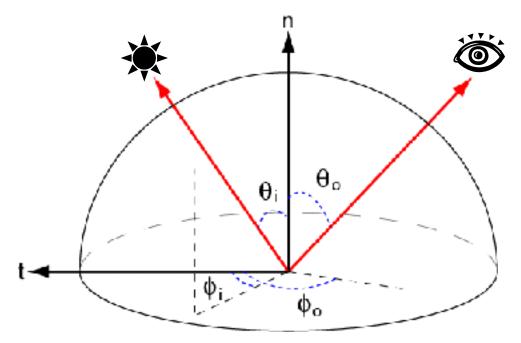

## **Empirical Models**

Ideally measure BRDF for "all" combinations of angles:  $\theta_i, \phi_i, \theta_o, \phi_o$ 

- Difficult in practice
- Too much storage

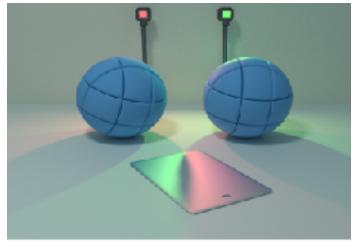

#### **Parametric Models**

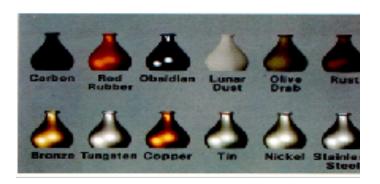

Approximate BRDF with simple parametric function that is fast to compute.

- Phong [75]
- Blinn-Phong [77]
- Cook-Torrance [81]
- He et al. [91]
- Ward [92]
- Lafortune et al. [97]
- Ashikhmin et al. [00]
- etc.

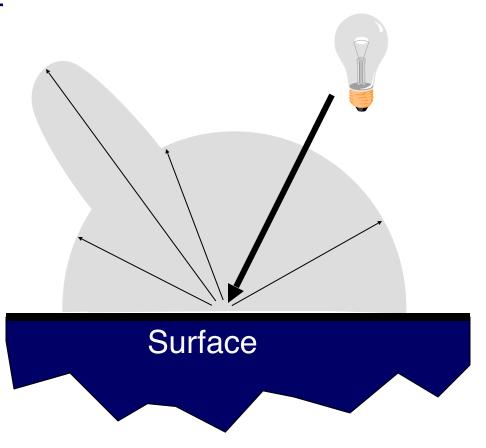

Lafortune [97]

- Simple analytic model:
  - diffuse reflection +
  - specular reflection +
  - emission +
  - "ambient"

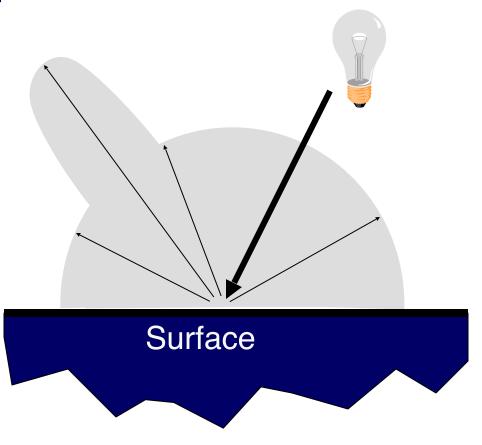

Based on model proposed by Phong

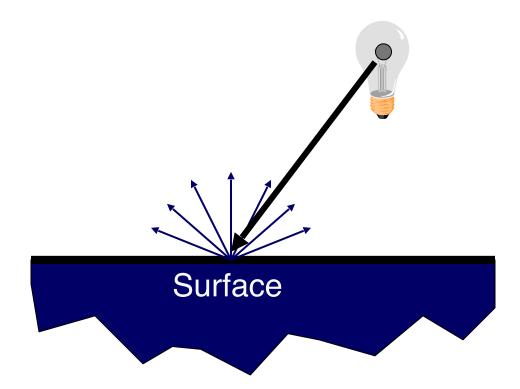

- Simple analytic model:
  - diffuse reflection +
  - specular reflection +
  - emission +
  - "ambient"

Based on model proposed by Phong

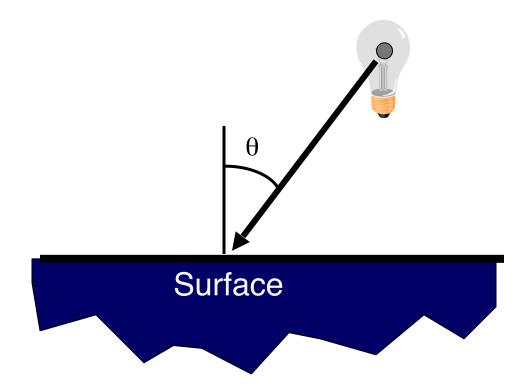

- Assume surface reflects equally in all directions
  - Examples: chalk, clay

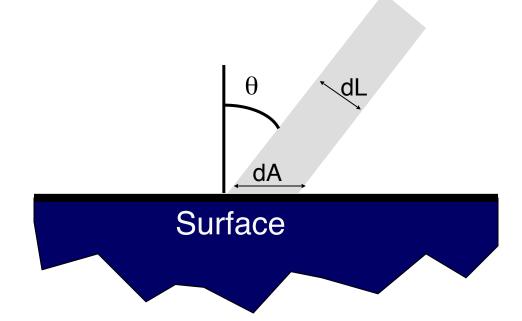

- What is brightness of surface?
  - Depends on angle of incident light

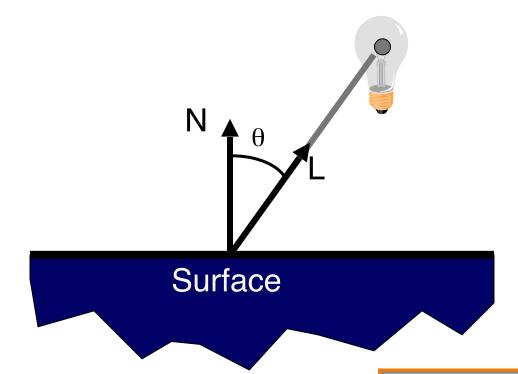

- What is brightness of surface?
  - Depends on angle of incident light

$$dL = dA \cos \Theta$$

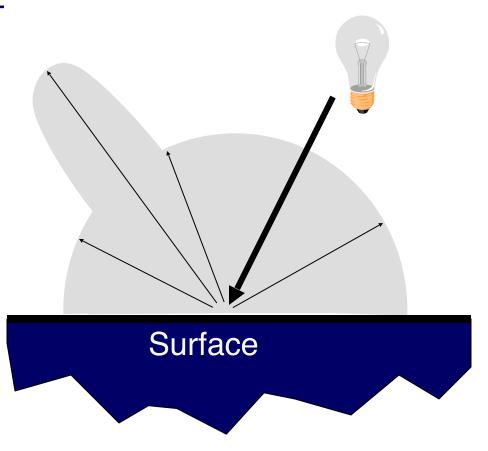

- Lambertian model
  - cosine law (dot product)

$$I_D = K_D(N \cdot L)I_L$$

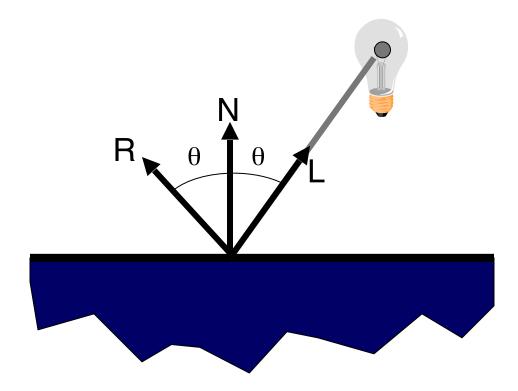

- Simple analytic model:
  - diffuse reflection +
  - specular reflection +
  - emission +
  - "ambient"

## **Specular Reflection**

- Reflection is strongest near mirror angle
  - Examples: mirrors, metals

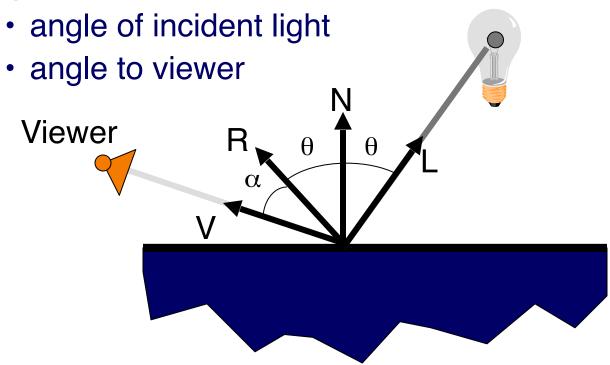

## **Specular Reflection**

How much light is seen?

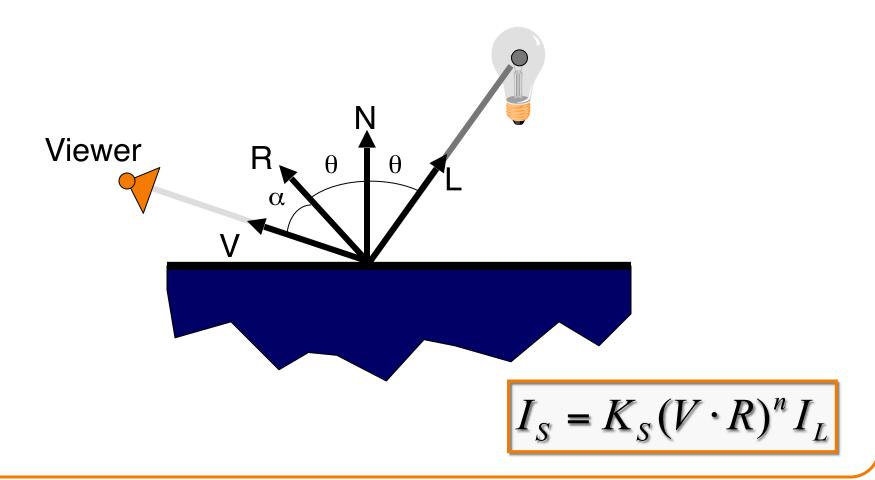

#### Depends on:

## **Specular Reflection**

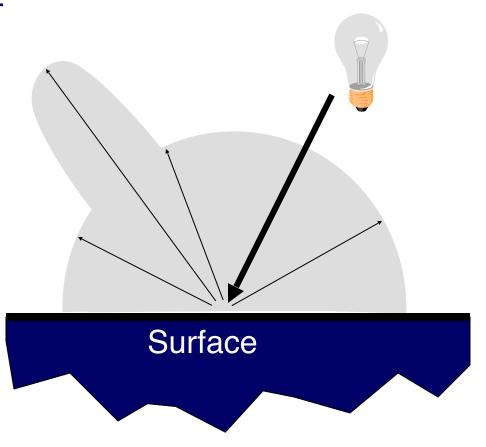

- Phong Model
  - $(\cos \alpha)^n$  This is a (vaguely physically-motivated) hack!

- Simple analytic model:
  - diffuse reflection +
  - specular reflection +
  - emission +
  - "ambient"

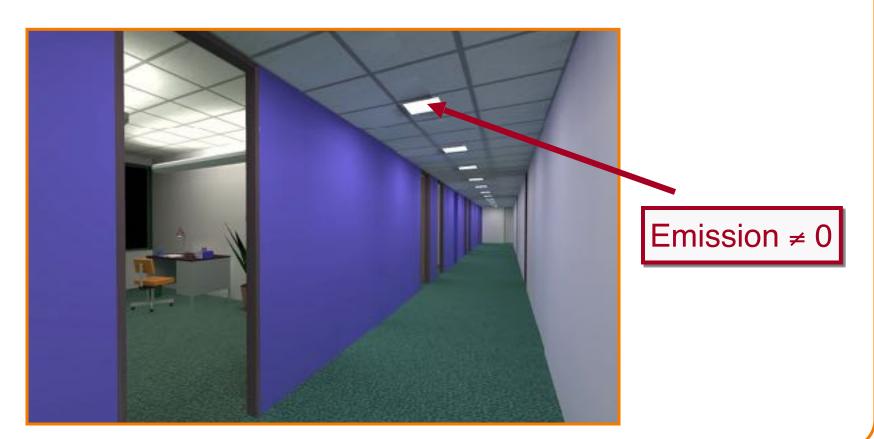

#### **Emission**

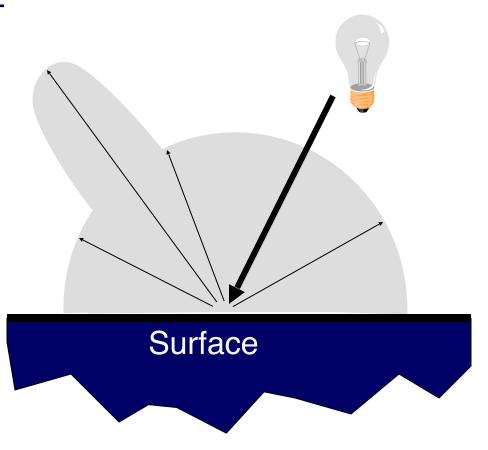

#### Represents light emanating directly from surface

Note: does not automatically act as light source!
 Does not affect other surfaces in scene!

- Simple analytic model:
  - diffuse reflection +
  - specular reflection +
  - emission +
  - · "ambient"

#### **Ambient Term**

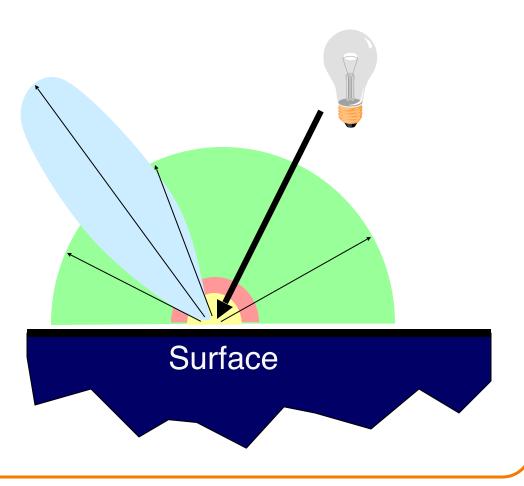

#### Represents reflection of all indirect illumination

This is a hack (avoids complexity of global illumination)!

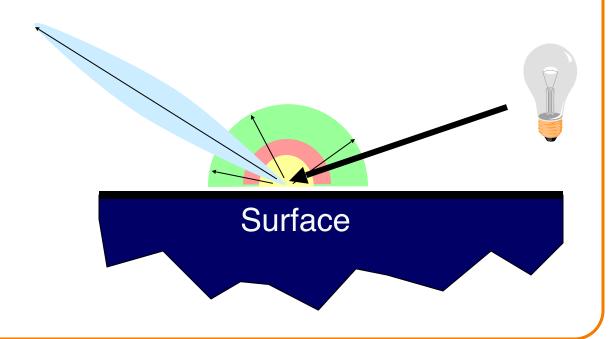

- Simple analytic model:
  - diffuse reflection +
  - specular reflection +
  - emission +
  - · "ambient"

- Simple analytic model:
  - diffuse reflection +
  - specular reflection +
  - emission +
  - · "ambient"

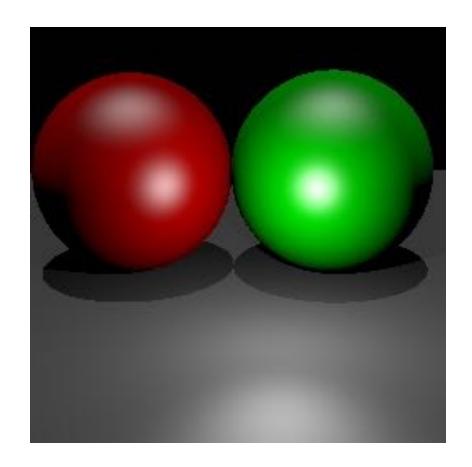

Sum diffuse, specular, emission, and ambient

Phong	$\rho_{ambient}$	$\rho_{ m diffuse}$	P <sub>specular</sub>	$\rho_{\rm total}$
φ <sub>i</sub> = 60°		**		
φ <sub>i</sub> = 25°	•			
$\phi_i = 0^{\circ}$	•			

Leonard McMillan, MIT

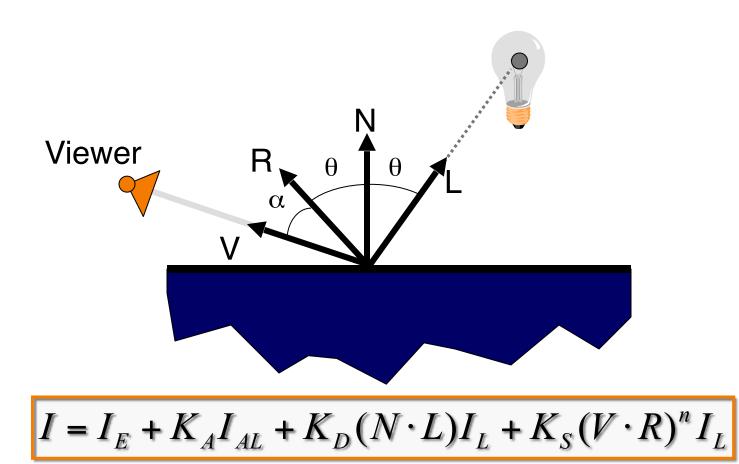

Good model for plastic surfaces, ...

#### **Direct Illumination Calculation**

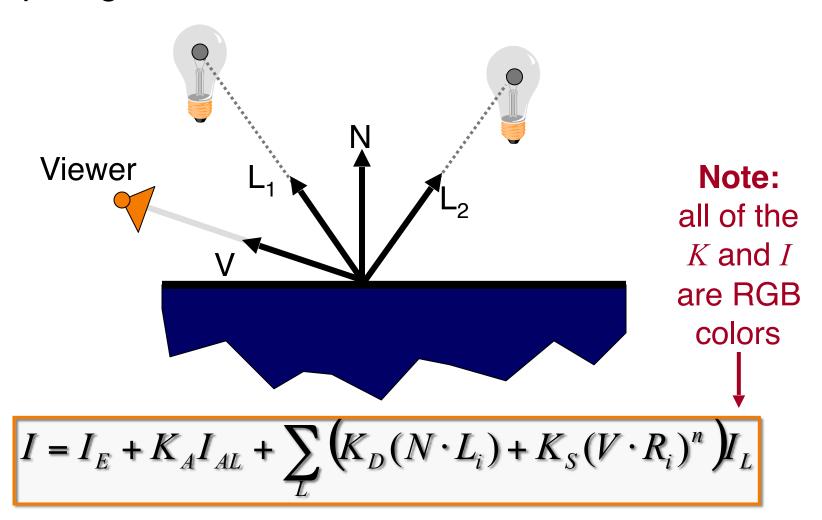

#### Single light source:

### **Direct Illumination Calculation**

### Multiple light sources:

# **Example from production**

This scene had 400 virtual lights (~100 params)

### **Overview**

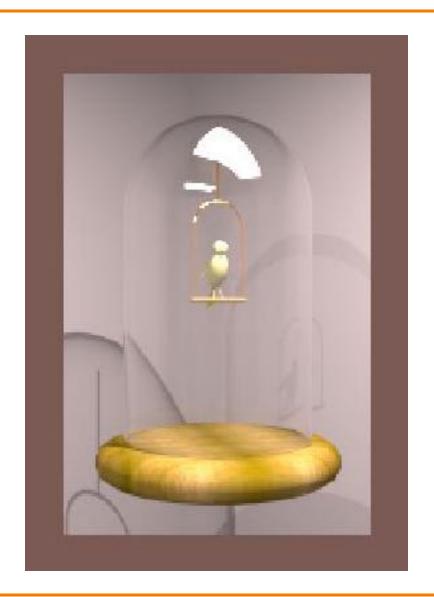

- Direct Illumination
  - Emission at light sources
  - Scattering at surfaces
- Global illumination
  - Shadows
  - Transmissions
  - Inter-object reflections

Global Illumination

# **Global Illumination**

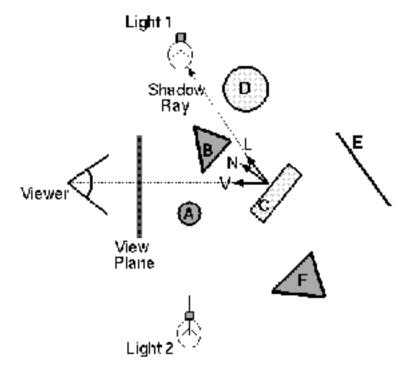

Greg Ward

# Ray Casting (last lecture)

#### Trace primary rays from camera

Direct illumination from unblocked lights only

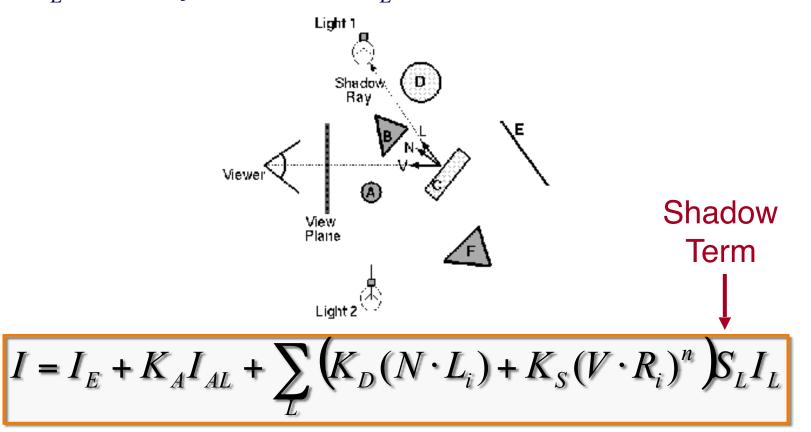

$$I = I_E + K_A I_{AL} + \sum_{L} \left( K_D (N \cdot L_i) + K_S (V \cdot R_i)^n \right) I_L$$

### **Shadows**

### Shadow term tells if light sources are blocked

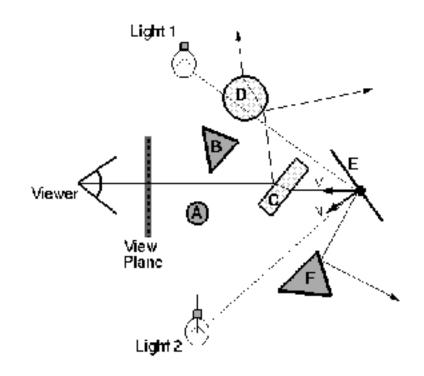

- Cast ray towards each light source
- $S_L = 0$  if ray is blocked,  $S_L = 1$  otherwise

#### Also trace secondary rays from hit surfaces

Mirror reflection and transparency

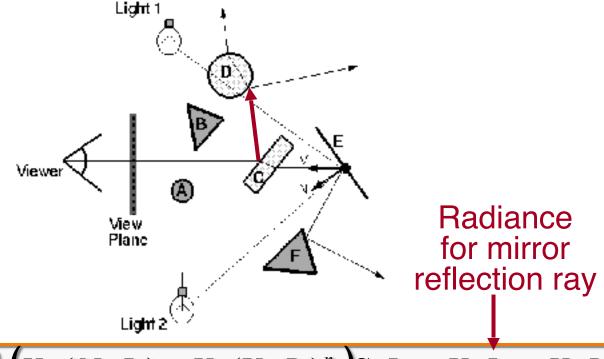

$$I = I_E + K_A I_{AL} + \sum_{L} \left( K_D (N \cdot L_i) + K_S (V \cdot R_i)^n \right) S_L I_L + \left( K_S I_R + K_T I_T \right)^n$$

### Mirror reflections

### Trace secondary ray in mirror direction

Evaluate radiance along secondary ray and include it into illumination model

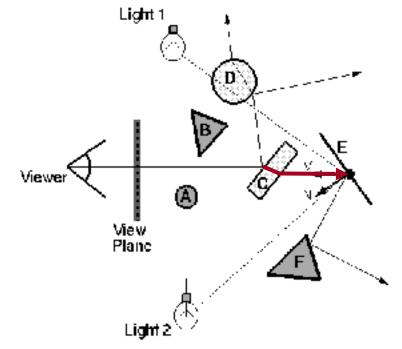

$$I = I_E + K_A I_{AL} + \sum_{r} (K_D (N \cdot L_i) + K_S (V \cdot R_i)^n) S_L I_L + K_S I_R + K_T I_T$$

### **Transparency**

### Trace secondary ray in direction of refraction

Evaluate radiance along secondary ray and include it into illumination model

Radiance for refraction ray

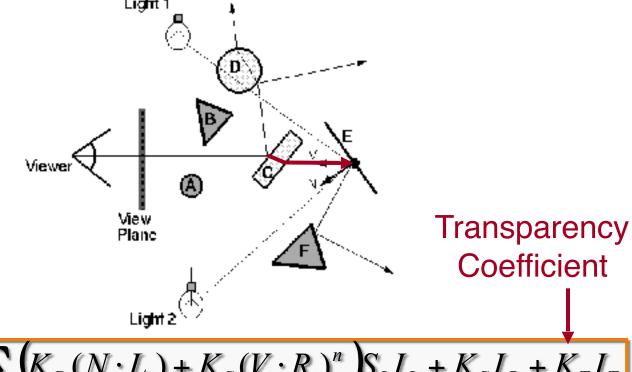

$$I = I_E + K_A I_{AL} + \sum_{i} (K_D (N \cdot L_i) + K_S (V \cdot R_i)^n) S_L I_L + K_S I_R + K_T I_T$$

### **Transparency**

### Transparency coefficient is fraction transmitted

- $K_T = 1$  for translucent object,  $K_T = 0$  for opaque
- $0 < K_T < 1$  for object that is semi-translucent

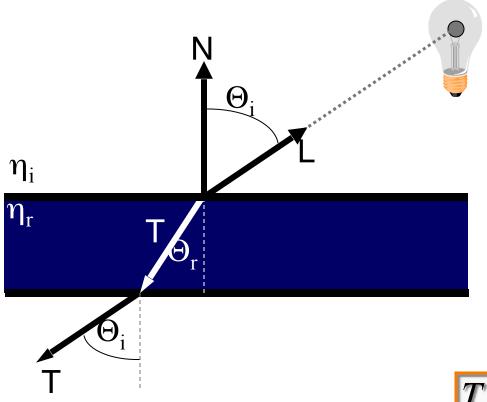

$$I = I_E + K_A I_{AL} + \sum_{L} (K_D (N \cdot L_i) + K_S (V \cdot R_i)^n) S_L I_L + K_S I_R + K_T I_T$$

# **Refractive Transparency**

For thin surfaces, can ignore change in direction

Assume light travels straight through surface

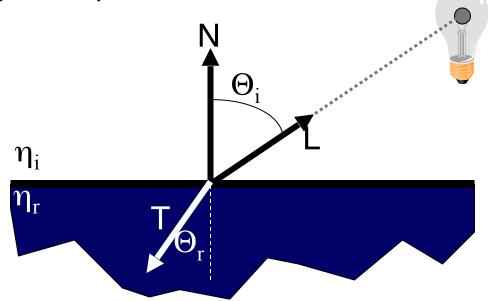

# **Refractive Tranparency**

For solid objects, apply Snell's law:

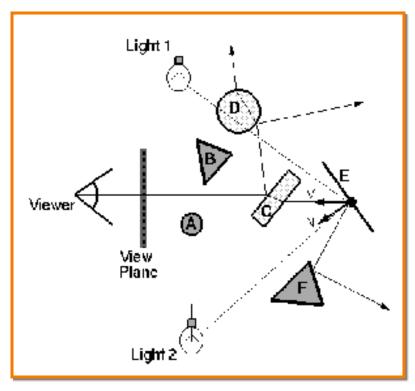

$$\eta_r \sin \Theta_r = \eta_i \sin \Theta_i$$

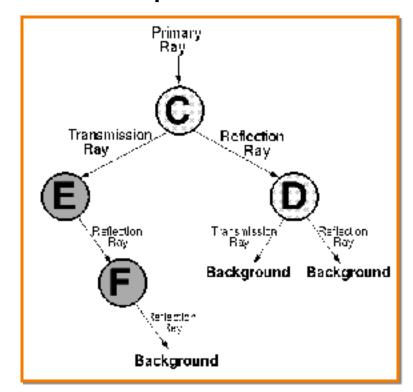

$$T = (\frac{\eta_i}{\eta_r} \cos \Theta_i - \cos \Theta_r) N - \frac{\eta_i}{\eta_r} L$$

#### Ray tree represents illumination computation

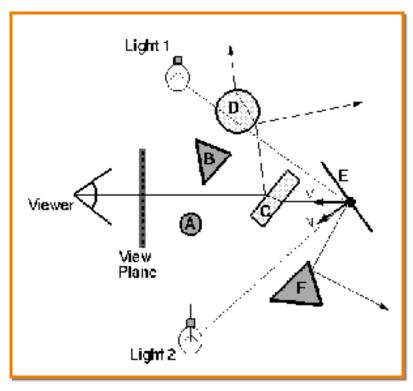

Ray traced through scene

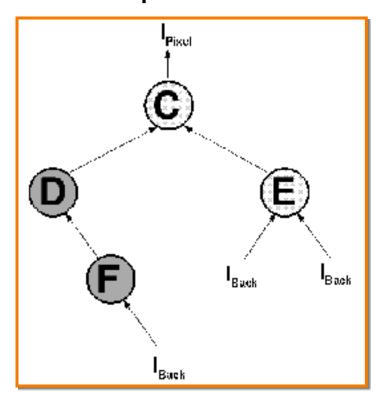

Ray tree

$$I = I_E + K_A I_{AL} + \sum_{L} (K_D (N \cdot L_i) + K_S (V \cdot R_i)^n) S_L I_L + K_S I_R + K_T I_T$$

#### Ray tree represents illumination computation

Ray traced through scene

Ray tree

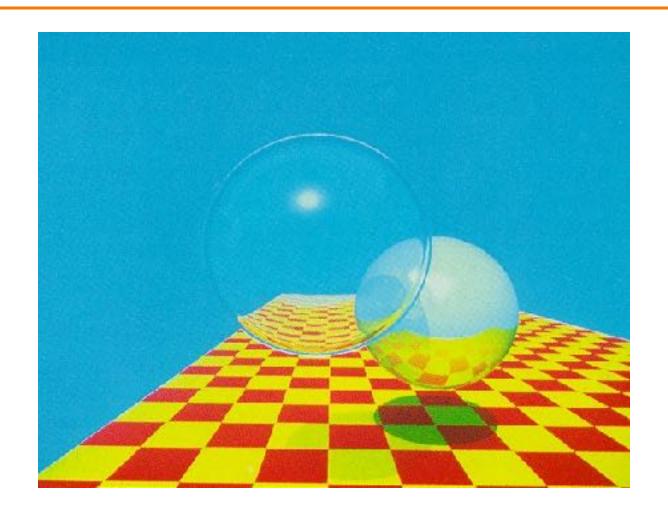

$$I = I_E + K_A I_{AL} + \sum_{L} (K_D (N \cdot L_i) + K_S (V \cdot R_i)^n) S_L I_L + K_S I_R + K_T I_T$$

### ComputeRadiance is called recursively

# **Example**

Turner Whitted, 1980 (74 minutes)

### **Summary**

- Ray casting (direct Illumination)
  - Usually use simple analytic approximations for light source emission and surface reflectance
- Recursive ray tracing (global illumination)
  - Incorporate shadows, mirror reflections, and pure refractions

All of this is an approximation so that it is practical to compute

More on global illumination after next week!

### **Illumination Terminology**

- Radiant power [flux] (Φ)
  - Rate at which light energy is transmitted (in Watts).
- Radiant Intensity (I)
  - Power radiated onto a unit solid angle in direction (in Watts/sr)
    - » e.g.: energy distribution of a light source (inverse square law)
- Radiance (L)
  - Radiant intensity per unit projected surface area (in Watts/m²sr)
    - » e.g.: light carried by a single ray (no inverse square law)
- Irradiance (E)
  - Incident flux density on a locally planar area (in Watts/m²)
    - » e.g.: light hitting a surface at a point
- Radiosity (B)
  - Exitant flux density from a locally planar area (in Watts/m<sup>2</sup>)
