Parsing III: LR parsing

Bottom-up parsing

- Stack holds a word in $(N \cup \Sigma)^*$ from which it is possible to derive the part of the input string that has been consumed
- At any time, may read a letter from input string and push it on top of the stack
- At any time, may non-deterministically choose a rule $A ::= \gamma_1 \dots \gamma_n$ and apply it **in reverse**: pop $\gamma_n \dots \gamma_1$ off the top of the stack, and push A .
- Accept when stack just contains start non-terminal

$\langle S \rangle ::= \langle B \rangle + \langle S \rangle \mid \langle B \rangle$

$\langle B \rangle ::= (\langle S \rangle) \mid x$

$$\langle S \rangle ::= \langle B \rangle + \langle S \rangle \mid \langle B \rangle$$

$$\langle B \rangle ::= (\langle S \rangle) \mid x$$

$$\begin{aligned} (, \epsilon &\rightarrow (\\), \epsilon &\rightarrow) \\ +, \epsilon &\rightarrow + \\ x, \epsilon &\rightarrow x \end{aligned}$$

$$\begin{aligned} \epsilon, \langle S \rangle + \langle B \rangle &\rightarrow \langle S \rangle \\ \epsilon, \langle B \rangle &\rightarrow \langle S \rangle \\ \epsilon,) \langle S \rangle (&\rightarrow \langle B \rangle \\ \epsilon, x &\rightarrow \langle B \rangle \end{aligned}$$

State	Stack	Input
q_0	ϵ	$(x+x)+x$
q_1	$\$$	$(x+x)+x$
q_1	$(\$$	$x+x)+x$
q_1	$x(\$$	$+x)+x$
q_1	$\langle B \rangle(\$$	$+x)+x$
q_1	$+ \langle B \rangle(\$$	$x)+x$
q_1	$x + \langle B \rangle(\$$	$) + x$
q_1	$\langle B \rangle + \langle B \rangle(\$$	$) + x$
q_1	$\langle S \rangle + \langle B \rangle(\$$	$) + x$
q_1	$\langle S \rangle(\$$	$) + x$
q_1	$) \langle S \rangle(\$$	$+ x$
q_1	$\langle B \rangle \$$	$+ x$
q_1	$+ \langle B \rangle \$$	x
q_1	$x + \langle B \rangle \$$	ϵ
q_1	$\langle B \rangle + \langle B \rangle \$$	ϵ
q_1	$\langle S \rangle + \langle B \rangle \$$	ϵ
q_1	$\langle S \rangle \$$	ϵ
q_f	ϵ	ϵ

LL vs LR

- LL parsers are top-down, LR parsers are bottom-up
- Easier to write LR grammars
 - Every LL(k) grammar is also LR(k), but not vice versa.
 - No need to eliminate left (or right) recursion
 - No need to left-factor
- Harder to write LR parsers
 - But parser generators will do it for us!

Bottom-up PDA has two kinds of actions:

- **Shift**: move lookahead token to the top of the stack
- **Reduce**: remove $\gamma_n, \dots, \gamma_1$ from the top of the stack, replace with A (where $A ::= \gamma_1 \dots \gamma_n$ is a rule of the grammar)
- Just as for LL parsing, the trick is to resolve non-determinism.
 - When should the parser shift?
 - When should the parser reduce?

$\langle S \rangle ::= \langle B \rangle + \langle S \rangle \mid \langle B \rangle$

$\langle B \rangle ::= (\langle S \rangle) \mid x$

Determinizing the bottom-up PDA

- **Intuition:** reduce greedily
 - If any reduce action applies, then apply it
 - Actually, a bit more nuanced: only apply reduction action if it is “relevant” (can eventually lead to the input word being accepted)
 - If no reduce action applies, then shift
- Can use the states of the PDA to implement greedy strategy
 - State tracks top few symbols of the stack

Determinizing the bottom-up PDA

- **Intuition:** reduce greedily
 - If any reduce action applies, then apply it
 - Actually, a bit more nuanced: only apply reduction action if it is “relevant” (can eventually lead to the input word being accepted)
 - If no reduce action applies, then shift
- Can use the states of the PDA to implement greedy strategy
 - State tracks top few symbols of the stack
- **Challenge:** after applying reduce action, need to re-compute the state

Determinizing the bottom-up PDA

- **Intuition:** reduce greedily
 - If any reduce action applies, then apply it
 - Actually, a bit more nuanced: only apply reduction action if it is “relevant” (can eventually lead to the input word being accepted)
 - If no reduce action applies, then shift
- Can use the states of the PDA to implement greedy strategy
 - State tracks top few symbols of the stack
- **Challenge:** after applying reduce action, need to re-compute the state
- **Solution:** use the stack to store *states*
 - Shift reads current state off the top of the stack, then pushes the next state
 - Reduce $A ::= \gamma_1, \dots, \gamma_n$ pops last n states, then proceeds from $(n - 1)$ th state as if A had been read

Warm-up: LR(0) parsing

$$\langle S \rangle ::= (\langle L \rangle) \mid x$$
$$\langle L \rangle ::= \langle S \rangle \mid \langle L \rangle ; \langle S \rangle$$

- $LR(0)$ = LR with 0-symbol lookahead
- An **LR(0) item** of a grammar $G = (N, \Sigma, R, S)$ is of the form $A ::= \gamma_1 \dots \gamma_i \bullet \gamma_{i+1} \dots \gamma_n$, where $A ::= \gamma_1 \dots \gamma_n$ is a rule of G
 - $\gamma_1 \dots \gamma_i$ derives part of the word that has already been read
 - $\gamma_{i+1} \dots \gamma_n$ derives part of the word that remains to be read
 - LR(0) items \sim states of an NFA that determines when a reduction applies to the top of the stack
- LR(0) items for the above grammar:
 - $\langle S \rangle ::= \bullet(\langle L \rangle), \langle S \rangle ::= (\bullet\langle L \rangle), \langle S \rangle ::= (\langle L \rangle\bullet), \langle S \rangle ::= (\langle L \rangle)\bullet,$
 - $\langle S \rangle ::= \bullet x, \langle S \rangle ::= x\bullet,$
 - $\langle L \rangle ::= \bullet\langle S \rangle, \langle L \rangle ::= \langle S \rangle\bullet,$
 - $\langle L \rangle ::= \bullet\langle L \rangle ; \langle S \rangle, \langle L \rangle ::= \langle L \rangle \bullet ; \langle S \rangle, \langle L \rangle ::= \langle L \rangle ; \bullet\langle S \rangle, \langle L \rangle ::= \langle L \rangle ; \langle S \rangle \bullet,$

closure and goto

- For any set of items I , define **closure**(I) to be the least set of items such that
 - **closure**(I) contains I
 - If **closure**(I) contains an item of the form $A ::= \alpha \bullet B\beta$ where A is a non-terminal, then **closure**(I) contains $B ::= \bullet\gamma$ for all $B ::= \gamma \in R$
- **closure**(I) saturates I with all items that may be relevant to reducing via I
 - E.g., **closure**($\{\langle S \rangle ::= (\bullet\langle L \rangle)\}$) =
 $\{\langle S \rangle ::= (\bullet\langle L \rangle), \langle L \rangle ::= \bullet\langle S \rangle, \langle L \rangle ::= \bullet\langle L \rangle; \langle S \rangle, \langle S \rangle ::= \bullet(\langle L \rangle)\langle S \rangle ::= \bullet x\}$
 - Part of the not-quite greedy strategy: don't try to reduce using all rules all the time, track only a relevant subset

closure and goto

- For any set of items I , define **closure**(I) to be the least set of items such that
 - **closure**(I) contains I
 - If **closure**(I) contains an item of the form $A ::= \alpha \bullet B\beta$ where A is a non-terminal, then **closure**(I) contains $B ::= \bullet\gamma$ for all $B ::= \gamma \in R$
- **closure**(I) saturates I with all items that may be relevant to reducing via I
 - E.g., **closure**($\{\langle S \rangle ::= (\bullet\langle L \rangle)\}$) =
 $\{\langle S \rangle ::= (\bullet\langle L \rangle), \langle L \rangle ::= \bullet\langle S \rangle, \langle L \rangle ::= \bullet\langle L \rangle; \langle S \rangle, \langle S \rangle ::= \bullet(\langle L \rangle)\langle S \rangle ::= \bullet x\}$
 - Part of the not-quite greedy strategy: don't try to reduce using all rules all the time, track only a relevant subset
- For any item set I , and (terminal or non-terminal) symbol $\gamma \in N \cup \Sigma$ define **goto**(I, γ) = **closure**($\{A ::= \alpha\gamma \bullet \beta \mid A ::= \alpha \bullet \gamma\beta \in I\}$)
 - I.e., **goto**(I, γ) is the result of “moving \bullet across γ ”
 - E.g., **goto**(**closure**($\{\langle S \rangle ::= (\bullet\langle L \rangle)\}$), $\langle L \rangle$) = $\{\langle S \rangle ::= (\langle L \rangle\bullet), \langle L \rangle ::= \langle L \rangle\bullet; \langle S \rangle, \}$

Mechanical construction of LR(0) parsers

1 Add a new production $S' ::= S\$$ to the grammar.

- S' is new start symbol
- $\$$ marks end of the stack

2 Construct transitions as follows: for each closed item set I ,

- For each item of the form $A ::= \gamma_1 \dots \gamma_n \bullet$ in I , add *reduce* transition

$$\epsilon, IJ_1 \dots J_{n-1}K \rightarrow K'K, \text{ where } K' = \text{goto}(K, A)$$

- For each item of the form $A ::= \gamma \bullet a\beta$ in I with $a \in \Sigma$, add a *shift* transition

$$a, I \rightarrow I'I \text{ where } I' = \text{goto}(I, a)$$

Resulting automaton is deterministic \iff grammar is LR(0)

Example run

$$\langle S \rangle ::= (\langle L \rangle) \mid x$$
$$\langle L \rangle ::= \langle S \rangle \mid \langle L \rangle ; \langle S \rangle$$

- Input word: $(x;x)\$$

- Stack:

$$\left\{ \begin{array}{l} \langle S' \rangle ::= \bullet \langle S \rangle \$, \\ \langle S \rangle ::= \bullet (\langle L \rangle), \\ \langle S \rangle ::= \bullet x \end{array} \right\}$$

- Action: **shift**

Example run

$$\langle S \rangle ::= (\langle L \rangle) \mid x$$
$$\langle L \rangle ::= \langle S \rangle \mid \langle L \rangle ; \langle S \rangle$$

- Input word: $(x;x)\$$

- Stack:

$$\left\{ \begin{array}{l} \langle S' \rangle ::= \bullet \langle S \rangle \$, \\ \langle S \rangle ::= \bullet (\langle L \rangle), \\ \langle S \rangle ::= \bullet x \end{array} \right\} \left\{ \begin{array}{l} \langle S \rangle ::= (\bullet \langle L \rangle) \\ \langle L \rangle ::= \bullet \langle S \rangle \\ \langle L \rangle ::= \bullet \langle L \rangle ; \langle S \rangle \\ \langle S \rangle ::= \bullet (\langle L \rangle) \\ \langle S \rangle ::= \bullet x \end{array} \right\}$$

- Action: **shift**

Example run

$$\langle S \rangle ::= (\langle L \rangle) \mid x$$
$$\langle L \rangle ::= \langle S \rangle \mid \langle L \rangle ; \langle S \rangle$$

- Input word: $(x;x)\$$

- Stack:

$$\left\{ \begin{array}{l} \langle S' \rangle ::= \bullet \langle S \rangle \$, \\ \langle S \rangle ::= \bullet (\langle L \rangle), \\ \langle S \rangle ::= \bullet x \end{array} \right\} \left\{ \begin{array}{l} \langle S \rangle ::= (\bullet \langle L \rangle) \\ \langle L \rangle ::= \bullet \langle S \rangle \\ \langle L \rangle ::= \bullet \langle L \rangle ; \langle S \rangle \\ \langle S \rangle ::= \bullet (\langle L \rangle) \\ \langle S \rangle ::= \bullet x \end{array} \right\} \{ \langle S \rangle ::= x \bullet \}$$

- Action: **reduce**

Example run

$$\langle S \rangle ::= (\langle L \rangle) \mid x$$
$$\langle L \rangle ::= \langle S \rangle \mid \langle L \rangle ; \langle S \rangle$$

- Input word: $(x;x)\$$

- Stack:

$$\left\{ \begin{array}{l} \langle S' \rangle ::= \bullet \langle S \rangle \$, \\ \langle S \rangle ::= \bullet (\langle L \rangle), \\ \langle S \rangle ::= \bullet x \end{array} \right\} \left\{ \begin{array}{l} \langle S \rangle ::= (\bullet \langle L \rangle) \\ \langle L \rangle ::= \bullet \langle S \rangle \\ \langle L \rangle ::= \bullet \langle L \rangle ; \langle S \rangle \\ \langle S \rangle ::= \bullet (\langle L \rangle) \\ \langle S \rangle ::= \bullet x \end{array} \right\} \{ \langle L \rangle ::= \langle S \rangle \bullet \}$$

- Action: **reduce**

Example run

$$\langle S \rangle ::= (\langle L \rangle) \mid x$$
$$\langle L \rangle ::= \langle S \rangle \mid \langle L \rangle ; \langle S \rangle$$

- Input word: $(x;x)\$$

- Stack:

$$\left\{ \begin{array}{l} \langle S' \rangle ::= \bullet \langle S \rangle \$, \\ \langle S \rangle ::= \bullet (\langle L \rangle), \\ \langle S \rangle ::= \bullet x \end{array} \right\} \left\{ \begin{array}{l} \langle S \rangle ::= (\bullet \langle L \rangle) \\ \langle L \rangle ::= \bullet \langle S \rangle \\ \langle L \rangle ::= \bullet \langle L \rangle ; \langle S \rangle \\ \langle S \rangle ::= \bullet (\langle L \rangle) \\ \langle S \rangle ::= \bullet x \end{array} \right\} \left\{ \begin{array}{l} \langle S \rangle ::= (\langle L \rangle \bullet) \\ \langle L \rangle ::= \langle L \rangle \bullet ; \langle S \rangle \end{array} \right\}$$

- Action: **shift**

Example run

$$\langle S \rangle ::= (\langle L \rangle) \mid x$$
$$\langle L \rangle ::= \langle S \rangle \mid \langle L \rangle ; \langle S \rangle$$

- Input word: $(x;x)\$$

- Stack:

$$\left\{ \begin{array}{l} \langle S' \rangle ::= \bullet \langle S \rangle \$, \\ \langle S \rangle ::= \bullet (\langle L \rangle), \\ \langle S \rangle ::= \bullet x \end{array} \right\} \left\{ \begin{array}{l} \langle S \rangle ::= (\bullet \langle L \rangle) \\ \langle L \rangle ::= \bullet \langle S \rangle \\ \langle L \rangle ::= \bullet \langle L \rangle ; \langle S \rangle \\ \langle S \rangle ::= \bullet (\langle L \rangle) \\ \langle S \rangle ::= \bullet x \end{array} \right\} \left\{ \begin{array}{l} \langle S \rangle ::= (\langle L \rangle \bullet) \\ \langle L \rangle ::= \langle L \rangle \bullet ; \langle S \rangle \end{array} \right\} \left\{ \begin{array}{l} \langle L \rangle ::= \langle L \rangle ; \bullet \langle S \rangle \\ \langle S \rangle ::= \bullet (\langle L \rangle), \\ \langle S \rangle ::= \bullet x \end{array} \right\}$$

- Action: **shift**

Example run

$$\langle S \rangle ::= (\langle L \rangle) \mid x$$

$$\langle L \rangle ::= \langle S \rangle \mid \langle L \rangle ; \langle S \rangle$$

- Input word: $(x;x)\$$

- Stack:

$$\left\{ \begin{array}{l} \langle S' \rangle ::= \bullet \langle S \rangle \$, \\ \langle S \rangle ::= \bullet (\langle L \rangle), \\ \langle S \rangle ::= \bullet x \end{array} \right\} \left\{ \begin{array}{l} \langle S \rangle ::= (\bullet \langle L \rangle) \\ \langle L \rangle ::= \bullet \langle S \rangle \\ \langle L \rangle ::= \bullet \langle L \rangle ; \langle S \rangle \\ \langle S \rangle ::= \bullet (\langle L \rangle) \\ \langle S \rangle ::= \bullet x \end{array} \right\} \left\{ \begin{array}{l} \langle S \rangle ::= (\langle L \rangle \bullet) \\ \langle L \rangle ::= \langle L \rangle \bullet ; \langle S \rangle \end{array} \right\} \left\{ \begin{array}{l} \langle L \rangle ::= \langle L \rangle ; \bullet \langle S \rangle \\ \langle S \rangle ::= \bullet (\langle L \rangle), \\ \langle S \rangle ::= \bullet x \end{array} \right\} \left\{ \langle S \rangle ::= x \bullet \right\}$$

- Action: **reduce**

Example run

$$\langle S \rangle ::= (\langle L \rangle) \mid x$$
$$\langle L \rangle ::= \langle S \rangle \mid \langle L \rangle ; \langle S \rangle$$

- Input word: $(x;x)\$$

- Stack:

$$\left\{ \begin{array}{l} \langle S' \rangle ::= \bullet \langle S \rangle \$, \\ \langle S \rangle ::= \bullet (\langle L \rangle), \\ \langle S \rangle ::= \bullet x \end{array} \right\} \left\{ \begin{array}{l} \langle S \rangle ::= (\bullet \langle L \rangle) \\ \langle L \rangle ::= \bullet \langle S \rangle \\ \langle L \rangle ::= \bullet \langle L \rangle ; \langle S \rangle \\ \langle S \rangle ::= \bullet (\langle L \rangle) \\ \langle S \rangle ::= \bullet x \end{array} \right\} \left\{ \begin{array}{l} \langle S \rangle ::= (\langle L \rangle \bullet) \\ \langle L \rangle ::= \langle L \rangle \bullet ; \langle S \rangle \end{array} \right\} \left\{ \begin{array}{l} \langle L \rangle ::= \langle L \rangle ; \bullet \langle S \rangle \\ \langle S \rangle ::= \bullet (\langle L \rangle), \\ \langle S \rangle ::= \bullet x \end{array} \right\} \left\{ \langle L \rangle ::= \langle L \rangle ; \langle S \rangle \bullet \right\}$$

- Action: **reduce**

Example run

$$\langle S \rangle ::= (\langle L \rangle) \mid x$$
$$\langle L \rangle ::= \langle S \rangle \mid \langle L \rangle ; \langle S \rangle$$

- Input word: $(x;x)\$$

- Stack:

$$\left\{ \begin{array}{l} \langle S' \rangle ::= \bullet \langle S \rangle \$, \\ \langle S \rangle ::= \bullet (\langle L \rangle), \\ \langle S \rangle ::= \bullet x \end{array} \right\} \left\{ \begin{array}{l} \langle S \rangle ::= (\bullet \langle L \rangle) \\ \langle L \rangle ::= \bullet \langle S \rangle \\ \langle L \rangle ::= \bullet \langle L \rangle ; \langle S \rangle \\ \langle S \rangle ::= \bullet (\langle L \rangle) \\ \langle S \rangle ::= \bullet x \end{array} \right\} \left\{ \begin{array}{l} \langle S \rangle ::= (\langle L \rangle \bullet) \\ \langle L \rangle ::= \langle L \rangle \bullet ; \langle S \rangle \end{array} \right\}$$

- Action: **shift**

Example run

$$\langle S \rangle ::= (\langle L \rangle) \mid x$$
$$\langle L \rangle ::= \langle S \rangle \mid \langle L \rangle ; \langle S \rangle$$

- Input word: $(x;x)\$$

- Stack:

$$\left\{ \begin{array}{l} \langle S' \rangle ::= \bullet \langle S \rangle \$, \\ \langle S \rangle ::= \bullet (\langle L \rangle), \\ \langle S \rangle ::= \bullet x \end{array} \right\} \left\{ \begin{array}{l} \langle S \rangle ::= (\bullet \langle L \rangle) \\ \langle L \rangle ::= \bullet \langle S \rangle \\ \langle L \rangle ::= \bullet \langle L \rangle ; \langle S \rangle \\ \langle S \rangle ::= \bullet (\langle L \rangle) \\ \langle S \rangle ::= \bullet x \end{array} \right\} \left\{ \begin{array}{l} \langle S \rangle ::= (\langle L \rangle \bullet) \\ \langle L \rangle ::= \langle L \rangle \bullet ; \langle S \rangle \end{array} \right\} \left\{ \langle S \rangle ::= (\langle L \rangle) \bullet \right\}$$

- Action: **reduce**

Example run

$$\langle S \rangle ::= (\langle L \rangle) \mid x$$
$$\langle L \rangle ::= \langle S \rangle \mid \langle L \rangle ; \langle S \rangle$$

- Input word: $(x;x)\$$

- Stack:

$$\left\{ \begin{array}{l} \langle S' \rangle ::= \bullet \langle S \rangle \$, \\ \langle S \rangle ::= \bullet (\langle L \rangle), \\ \langle S \rangle ::= \bullet x \end{array} \right\} \{ \langle S' \rangle ::= \langle S \rangle \bullet \$ \}$$

- Action: **shift**

Example run

$$\langle S \rangle ::= (\langle L \rangle) \mid x$$
$$\langle L \rangle ::= \langle S \rangle \mid \langle L \rangle ; \langle S \rangle$$

- Input word: $(x;x)\$$

- Stack:

$$\left\{ \begin{array}{l} \langle S' \rangle ::= \bullet \langle S \rangle \$, \\ \langle S \rangle ::= \bullet (\langle L \rangle), \\ \langle S \rangle ::= \bullet x \end{array} \right\} \{ \langle S' \rangle ::= \langle S \rangle \bullet \$ \} \{ \langle S' \rangle ::= \langle S \rangle \$ \bullet \}$$

- Action: **accept**

Conflicts

- Recall: Automaton is deterministic \iff grammar is LR(0)
- Observe: for LR(0) grammars, each closed set of items is either a *reduce* state or a *shift* state
 - Reduce state has exactly one item, and it's of the form $\{A ::= \gamma\bullet\}$
 - Shift state has *no* items of the form $A ::= \gamma\bullet$
- **Reduce/reduce conflict**: state has two or more items of the form $A ::= \gamma\bullet$ (choice of reduction is non-deterministic!)
- **Reduce/reduce conflict**: state has an item of the form $A ::= \gamma\bullet$ *and* one of the form $A ::= \gamma\bullet a\beta$ (choice of whether to shift or reduce is non-deterministic!)

Simple LR (SLR)

- Simple LR is a straight-forward extension of LR(0) with a lookahead token
- **Idea:** proceed exactly as LR(0), but eliminate (some) conflicts using lookahead token
 - For each item of the form $A ::= \gamma_1 \dots \gamma_n \bullet$ in I , add *reduce* transition

$$\epsilon, IJ_1 \dots J_{n-1} K \rightarrow K' K, \text{ where } K' = \text{goto}(K, A)$$

with any lookahead token in $\text{follow}(A)$

- Example: the following grammar is SLR, but not LR(0)

$$\begin{aligned} \langle S \rangle &::= \langle T \rangle b \\ \langle T \rangle &::= a \langle T \rangle \mid \epsilon \end{aligned}$$

Consider: $\text{closure}(\{\langle S' \rangle ::= \bullet \langle S \rangle \$\})$ contains $T ::= \bullet$.

LR(1) parser construction

- An **LR(1) item** of a grammar $G = (N, \Sigma, R, S)$ is of the form $(A ::= \gamma_1 \dots \gamma_i \bullet \gamma_{i+1} \dots \gamma_n, a)$, where $A ::= \gamma_1 \dots \gamma_n$ is a rule of G and $a \in \Sigma$
 - $\gamma_1 \dots \gamma_i$ derives part of the word that has already been read
 - $\gamma_{i+1} \dots \gamma_n$ derives part of the word that remains to be read
 - a is a lookahead symbol
- For any set of items I , define **closure**(I) to be the least set of items such that
 - **closure**(I) contains I
 - If **closure**(I) contains an item of the form $(A ::= \alpha \bullet B\beta, a)$ where B is a non-terminal, then **closure**(I) contains $(B ::= \bullet \gamma, b)$ for all $B ::= \gamma \in R$ and all $b \in \text{first}(\beta a)$.
- Construct PDA as in LR(0)

LALR(1)

- LR(1) transition tables can be very large
- LALR(1) (“lookahead LR(1)”) make transition table smaller by merging states that are identical except for lookahead
- Merging states can create reduce/reduce conflicts. Say that a grammar is LALR(1) if this merging *doesn't* create conflicts.

Summary of parsing

- For any k , $LL(k)$ grammars are $LR(k)$
- SLR grammars are $LALR(1)$ are $LR(1)$
- In terms of *language expressivity*, there is an SLR (and therefore $LALR(1)$ and $LR(1)$ grammar for any context-free language that can be accepted by a deterministic pushdown automaton).
- Not every deterministic context free language is $LL(k)$: $\{a^n b^n : n \in \mathbb{N}\} \cup \{a^n c^n : n \in \mathbb{N}\}$ is DCFL but not $LL(k)$ for any k .¹

¹John C. Beatty, *Two iteration theorems for the $LL(k)$ Languages*
