3.1 Symbol Tables

- *API*
- *elementary implementations*
- *ordered operations*

Robert Sedgewick | Kevin Wayne

https://algs4.cs.princeton.edu

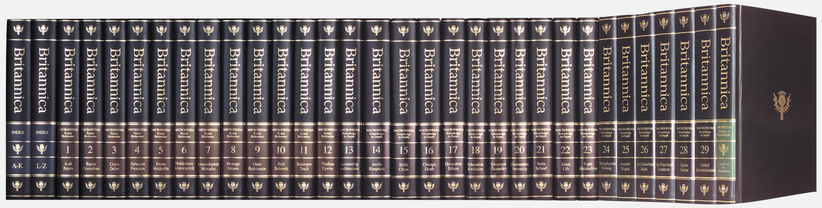
3.1 Symbol Tables

- *API*
- *elementary implementations*
- *ordered operations*

Why are telephone books obsolete?

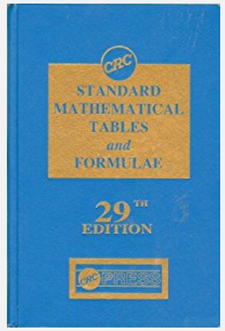
Unsupported operations.

- Add a new name and associated number.
- Remove a given name and associated number.
- Change the number associated with a given name.

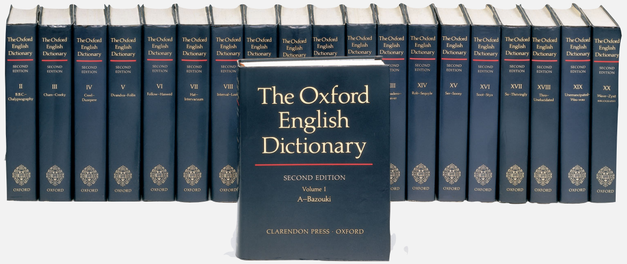


key = term
value = article

key = name
value = phone number



key = math function and input
value = function output



key = word
value = definition

key = time and channel
value = TV show

Symbol tables

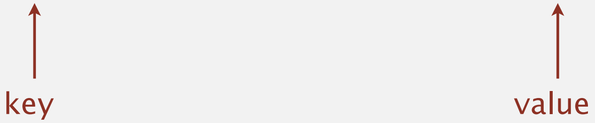
Key–value pair abstraction.

- Insert a value with specified key.
- Given a key, search for the corresponding value.

Ex. DNS lookup.

- Insert domain name with specified IP address.
- Given domain name, find corresponding IP address.

domain name	IP address
www.cs.princeton.edu	128.112.136.61
goprincetontigers.com	67.192.28.17
wikipedia.com	208.80.153.232
google.com	172.217.11.46



Symbol table applications

application	purpose of search	key	value
dictionary	find definition	word	definition
book index	find relevant pages	term	list of page numbers
file share	find song to download	name of song	computer ID
financial account	process transactions	account number	transaction details
web search	find relevant web pages	keyword	list of page names
compiler	find properties of variables	variable name	type and value
routing table	route Internet packets	destination	best route
DNS	find IP address	domain name	IP address
reverse DNS	find domain name	IP address	domain name
genomics	find markers	DNA string	known positions
file system	find file on disk	filename	location on disk

Symbol tables: context

Also known as: maps, dictionaries, associative arrays.

Generalizes arrays. Keys need not be integers between 0 and $n - 1$.

Language support.

- External libraries: C, VisualBasic, Standard ML, bash, ...
- Built-in libraries: Java, C#, C++, Scala, ...
- Built-in to language: Awk, Perl, PHP, Tcl, JavaScript, Python, Ruby, Lua.

```
has_nice_syntax_for_dictionaries['Python'] = True
has_nice_syntax_for_dictionaries['Java']   = False
```

legal Python code

Basic symbol table API

Associative array abstraction. Associate key–value pairs.

two generic type parameters

```
public class ST<Key extends Comparable<Key>, Value>
```

	`ST()`	*create an empty symbol table*
`void`	`put(Key key, Value val)`	*insert key–value pair* ← `a[key] = val;`
`Value`	`get(Key key)`	*value paired with key* ← `a[key]`
`Iterable<Key>`	`keys()`	*all the keys in the symbol table*
`boolean`	`contains(Key key)`	*is there a value paired with key?*
`void`	`delete(Key key)`	*remove key (and associated value)*
`boolean`	`isEmpty()`	*is the symbol table empty?*
`int`	`size()`	*number of key–value pairs*

Conventions

- Method `put()` overwrites old value with new value.
- Method `get()` returns `null` if key not present.
- Values are not `null`. ⟵ `java.util.Map` allows `null` values

> *“ Careless use of null can cause a staggering variety of bugs. Studying the Google code base, we found that something like 95% of collections weren’t supposed to have any null values in them, and having those fail fast rather than silently accept null would have been helpful to developers.”*

https://code.google.com/p/guava-libraries/wiki/UsingAndAvoidingNullExplained

Key and value types

Value type. Any generic type.

specify `Comparable` in API

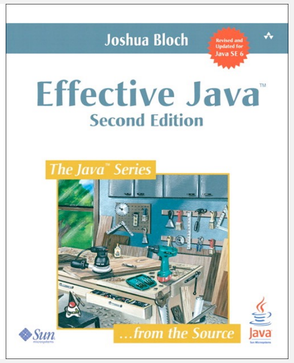
Key type: different assumptions.

- This lecture: keys are `Comparable`; use `compareTo()`.
- Hashing lecture: keys are any generic type;
  use `equals()` to test equality and `hashCode()` to scramble key.

Best practices. Use immutable types for symbol-table keys.

- Immutable in Java: `String`, `Integer`, `Double`, `Color`, ...
- Mutable in Java: `StringBuilder`, `Stack`, `URL`, arrays, ...

> *" Classes should be immutable unless there's a very good reason to make them mutable.... If a class cannot be made immutable, you should still limit its mutability as much as possible."*
>
> *— Joshua Bloch (Java architect)*



ST test client for analysis

Frequency counter. Read a sequence of strings from standard input; print one that occurs most often.

```
~/Desktop/st> more tinyTale.txt
it was the best of times
it was the worst of times
it was the age of wisdom
it was the age of foolishness
it was the epoch of belief
it was the epoch of incredulity
it was the season of light
it was the season of darkness
it was the spring of hope
it was the winter of despair

~/Desktop/st> java FrequencyCounter 3 < tinyTale.txt
the 10

~/Desktop/st> java FrequencyCounter 8 < tale.txt
business 10

~/Desktop/st> java FrequencyCounter 10 < leipzig1M.txt
government 24763
```

tiny example
(60 words, 20 distinct)

real example
(135,635 words, 10,769 distinct)

real example
(21,191,455 words, 534,580 distinct)

Frequency counter implementation

```
public class FrequencyCounter
{
   public static void main(String[] args)
   {
      int minLength = Integer.parseInt(args[0]);

      ST<String, Integer> st = new ST<>();
      while (!StdIn.isEmpty())
      {
         String word = StdIn.readString();
         if (word.length() < minLength) continue;
         if (!st.contains(word)) st.put(word, 1);
         else                    st.put(word, st.get(word) + 1);
      }

      String max = "";
      st.put(max, 0);
      for (String word : st.keys())
         if (st.get(word) > st.get(max))
            max = word;
      StdOut.println(max + " " + st.get(max));

   }
}
```

compute frequencies

create ST

read string and update frequency

print a string with max frequency

iterate over key–value pairs

3.1 Symbol Tables

- *API*
- *elementary implementations*
- *ordered operations*

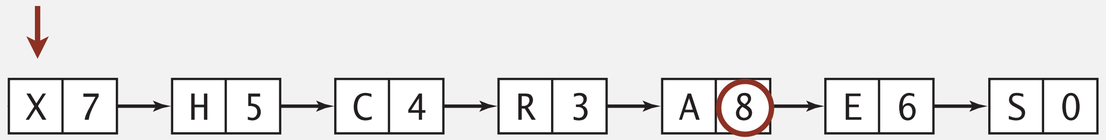
Sequential search in a linked list

Data structure. Maintain an (unordered) linked list of key–value pairs.

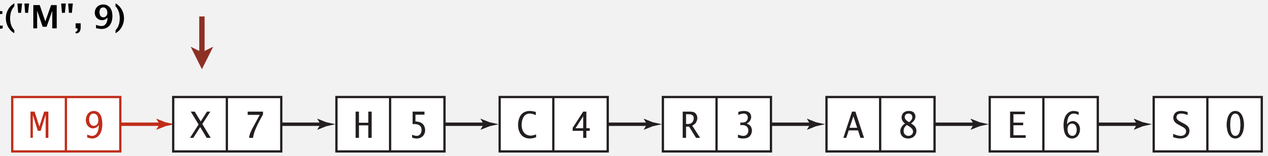
Search. Scan through all keys until find a match.

Insert. Scan through all keys until find a match; if no match add to front.

get("A")



put("M", 9)



Proposition. In the worst case, search and insert take $\Theta(n)$ time.

Elementary symbol tables: quiz 1

Data structure. Maintain parallel arrays for keys and values, sorted by key.

`keys[]`

0	1	2	3	4	5	6	7	8	9
A	C	E	H	L	M	P	R	S	Z

`vals[]`

0	1	2	3	4	5	6	7	8	9
8	4	2	5	11	9	10	3	0	7

What are the worst-case running times for search and insert?

A. $\Theta(\log n)$ and $\Theta(\log n)$

B. $\Theta(n)$ and $\Theta(\log n)$

C. $\Theta(\log n)$ and $\Theta(n)$

D. $\Theta(n)$ and $\Theta(n)$

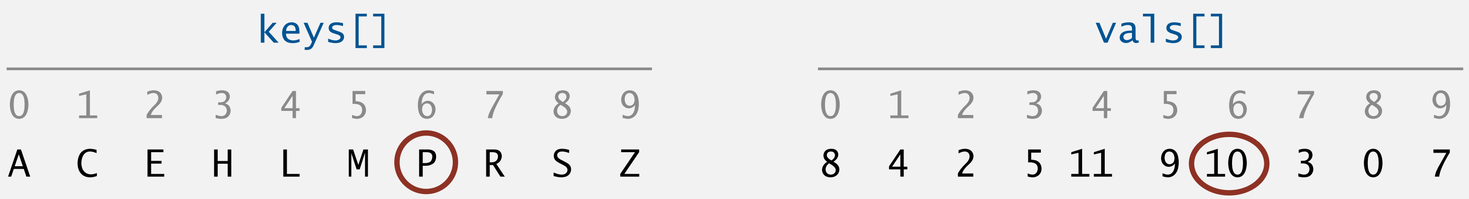
Binary search in a sorted array

Data structure. Maintain parallel arrays for keys and values, sorted by key.

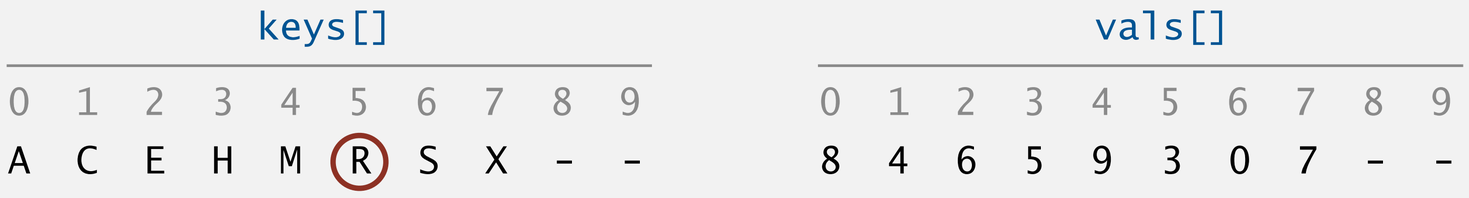
Search. Use binary search to find key.

Insert. Use binary search to find place to insert; shift all larger keys over.

get("P")



put("P", 10)



Elementary ST implementations: summary

implementation	guarantee		average case		operations on keys
	search	insert	search hit	insert	
sequential search (unordered list)	n	n	n	n	`equals()`
binary search (sorted array)	$\log n$	n †	$\log n$	n †	`compareTo()`

† can do with $\Theta(\log n)$ compares, but still requires $\Theta(n)$ array accesses

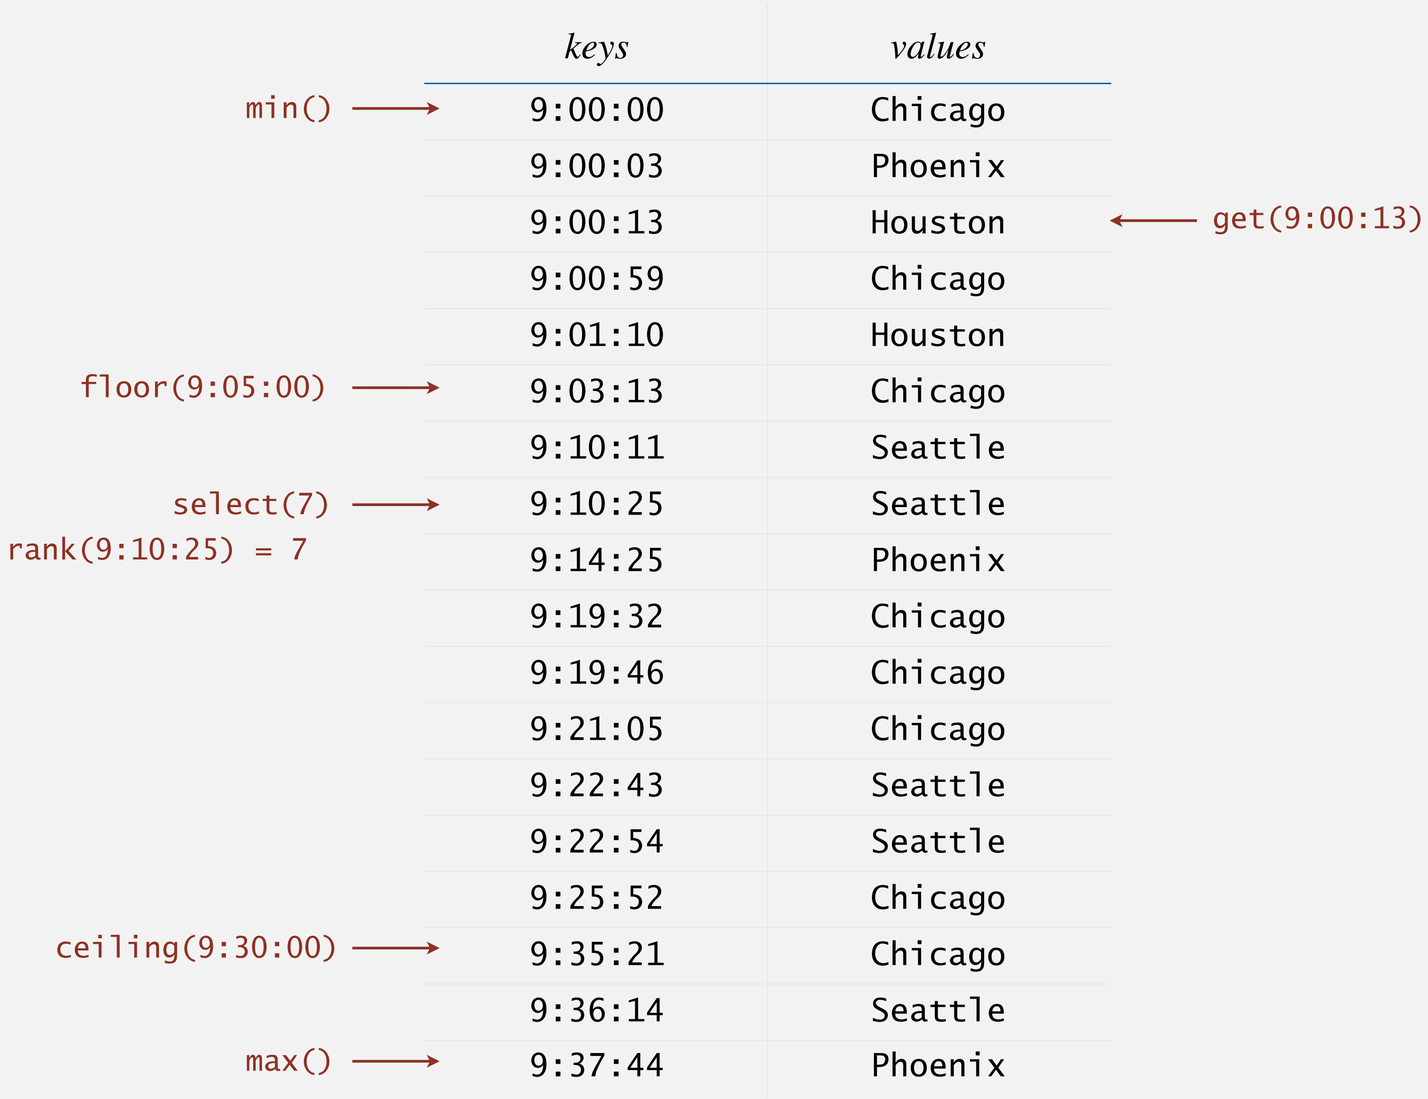
Challenge. Efficient implementations of both search and insert.

https://algs4.cs.princeton.edu

3.1 Symbol Tables

- *API*
- *elementary implementations*
- *ordered operations*

Examples of ordered symbol table API



Ordered symbol table API

public class ST<Key extends Comparable<Key>, Value>	
⋮	
Key min()	*smallest key*
Key max()	*largest key*
Key floor(Key key)	*largest key less than or equal to key*
Key ceiling(Key key)	*smallest key greater than or equal to key*
int rank(Key key)	*number of keys less than key*
Key select(int k)	*key of rank k*
⋮	

Rank in a Sorted Array

Problem. Given a sorted array of n distinct keys,

find the number of keys strictly less than a given query key.

Ordered symbol table operations: summary

	sequential search	binary search
search	n	$\log n$
insert	n	n
min / max	n	1
floor / ceiling	n	$\log n$
rank	n	$\log n$
select	n	1

order of growth of the running time for ordered symbol table operations

Challenge. Efficient implementations of all operations.
