

Passive Dynamics and Particle Systems

COS 426, Spring 2021

Felix Heide

Princeton University

Animation & Simulation

- Animation
 - Make objects change over time according to scripted actions
- Simulation / dynamics
 - Predict how objects change over time according to physical laws

Pixar

University of Illinois

Animation & Simulation

Keyframing:

- Manually specify a few poses; computer interpolates.
- Good for characters and simple motion.
- But many physical systems are too complex!

Simulation

1. Identify/derive mathematical model (ODE, PDE)
2. Develop computer model
3. Simulate

Simulation

Equations known for a long time

- Motion
(Newton, 1660)

$$d/dt(m\mathbf{v}) = \mathbf{f}$$

- Elasticity
(Hooke, 1670)

$$\boldsymbol{\sigma} = \mathbf{E}\boldsymbol{\varepsilon}$$

- Fluids
(Navier, Stokes, 1822)

$$\rho \left(\frac{\partial \mathbf{v}}{\partial t} + \mathbf{v} \cdot \nabla \mathbf{v} \right) = -k \nabla \rho + \rho \mathbf{g} + \mu \nabla^2 \mathbf{v}$$

1938: Zuse Z1

0.2 ops

2014: Tianhe-2 @ NUDT (China)

54,902 teraflops (3.12M cores)

Simulation

Physically-based simulation

- Computational Sciences
 - **Reproduction** of physical phenomena
 - Predictive capability
 - Substitute for expensive experiments

Simulation in Graphics

Physically-based simulation

- Computational Sciences
 - Reproduction of physical phenomena
 - Predictive capability
 - Substitute for expensive experiments
- Computer Graphics
 - Imitation of physical phenomena
 - Visually plausible behavior
 - Speed, stability, art-directability

Simulation: Speed

Simulation: Stability

<https://www.youtube.com/watch?v=tT81VPk ukU>

Simulation: Art-directability

Simulation in Graphics

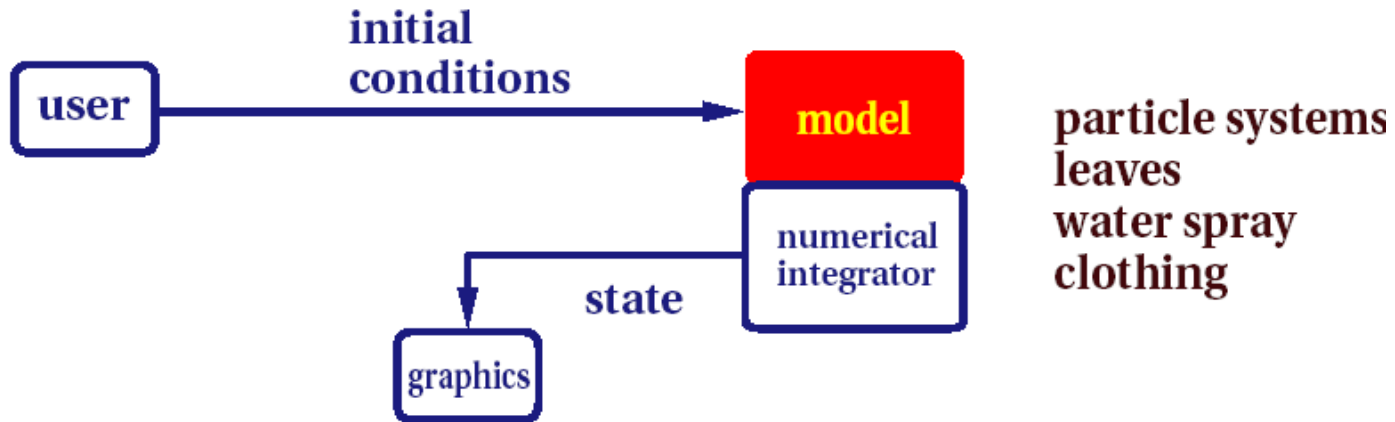

- Rigid bodies
 - Collision
 - Fracture
- Fluids
- Elasticity
 - Muscle + skin
 - Paper
 - Hair
 - Cloth
- etc...

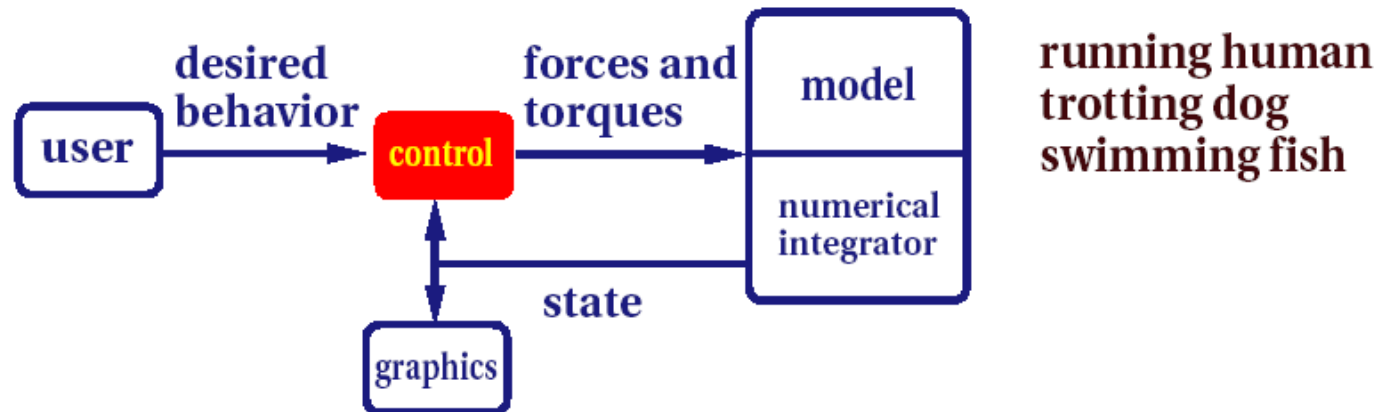

Dynamics

Passive--no muscles or motors

Active--internal source of energy

Passive Dynamics

- No muscles or motors
 - Smoke
 - Water
 - Cloth
 - Fire
 - Fireworks
 - Dice

Passive Dynamics

- Physical laws
 - Newton's laws
 - Hooke's law
 - Etc.
- Physical phenomena
 - Gravity
 - Momentum
 - Friction
 - Collisions
 - Elasticity
 - Fracture

Particle Systems

- A particle is a point mass

- Position
- Velocity
- Mass
- Drag
- Elasticity
- Lifetime
- Color

- Use many particles to model complex phenomena
 - Keep array of particles
 - Newton's laws

Particle Systems

- For each frame:
 - For each simulation step (Δt)
 - Create new particles and assign attributes
 - Update particles based on attributes and physics
 - Delete any expired particles
 - Render particles

Creating Particles

- Where to create particles?
 - Predefined source
 - Where particle density is low
 - etc.

Reeves

Creating Particles

- Where to create particles?
 - Predefined source
 - Where particle density is low
 - etc.

Creating Particles

- Example: particles emanating from shape
 - Line
 - Box
 - **Circle**
 - **Sphere**
 - Cylinder
 - Cone
 - Mesh

McAllister

Creating Particles

- Example: particles emanating from sphere

Selecting random position on surface of sphere

Rejection Sampling:

```
// pick random point in sphere
```

```
do {
```

```
  x,y,z = random(-1,1)
```

```
   $r_{sq} = x^2 + y^2 + z^2$ 
```

```
} while ( $r_{sq} > 1$ )
```

```
// normalize length
```

```
r = sqrt( $r_{sq}$ )
```

```
x /= r
```

```
y /= r
```

```
z /= r
```

Creating Particles

- Example: particles emanating from sphere

Selecting random direction within angle cutoff of normal

1. N = surface normal
2. A = any vector on tangent plane
3. $t1$ = random $[0, 2\pi)$
3. $t2$ = random $[0, \sin(\text{angle cutoff}))$
4. V = rotate A around N by $t1$
5. V = rotate V around $V \times N$ by $\text{acos}(t2)$

Example: Fountains

Example: Emission from Surface

Particle Systems

- For each frame:
 - For each simulation step (Δt)
 - Create new particles and assign attributes
 - Update particles based on attributes and physics
 - Delete any expired particles
 - Render particles

Equations of Motion

- Newton's Law for a point mass
 - $f = ma$
- Computing particle motion requires solving second-order differential equation

$$\ddot{x} = \frac{f(x, \dot{x}, t)}{m}$$

- Add variable v to form coupled **first-order** differential equations: “state-space form”

$$\begin{cases} \dot{x} = v \\ \dot{v} = \frac{f}{m} \end{cases}$$

Solving the Equations of Motion

- Initial value problem
 - Know $x(0)$, $v(0)$
 - Can compute force (and therefore acceleration) for any position / velocity / time
 - Compute $x(t)$ by forward integration

Solving the Equations of Motion

- Forward (explicit) Euler integration

Euler Step (1768)

$$y_{n+1} = y_n + h \cdot f(t_n, y_n)$$

- **Idea:** start at initial condition and take a step into the direction of the tangent.
- Iteration scheme: $y_n \rightarrow f(t_n, y_n) \rightarrow y_{n+1} \rightarrow f(t_{n+1}, y_{n+1}) \rightarrow \dots$

Solving the Equations of Motion

- Forward (explicit) Euler integration
 - $x(t+\Delta t) \leftarrow x(t) + \Delta t v(t)$
 - $v(t+\Delta t) \leftarrow v(t) + \Delta t f(x(t), v(t), t) / m$

Solving the Equations of Motion

- Forward (explicit) Euler integration
 - $x(t+\Delta t) \leftarrow x(t) + \Delta t v(t)$
 - $v(t+\Delta t) \leftarrow v(t) + \Delta t f(x(t), v(t), t) / m$
- Problem:
 - Accuracy decreases as Δt gets bigger

Solving the Equations of Motion

- Midpoint method

1. Compute an Euler step
2. Evaluate f at the **midpoint** of Euler step
3. Compute new position / velocity using midpoint velocity / acceleration

- $x_{\text{mid}} \leftarrow x(t) + \Delta t / 2 * v(t)$
- $v_{\text{mid}} \leftarrow v(t) + \Delta t / 2 * f(x(t), v(t), t) / m$
- $x(t+\Delta t) \leftarrow x(t) + \Delta t v_{\text{mid}}$
- $v(t+\Delta t) \leftarrow v(t) + \Delta t f(x_{\text{mid}}, v_{\text{mid}}, t) / m$

Euler

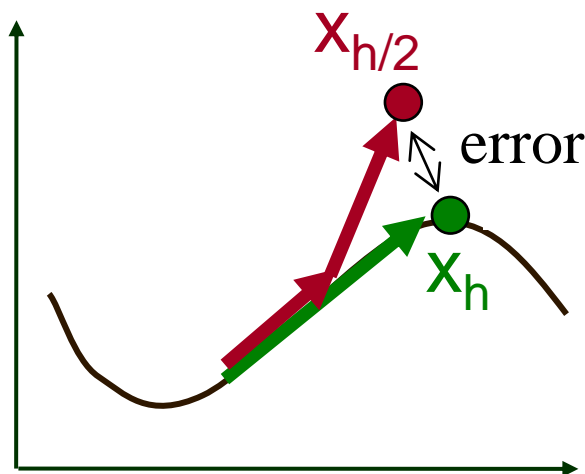

Midpoint

Solving the Equations of Motion

- Adaptive step size
 - Repeat until error is below threshold
 1. Compute x_h by taking one step of size h
 2. Compute $x_{h/2}$ by taking 2 steps of size $h / 2$
 3. Compute error = $|x_h - x_{h/2}|$
 4. If (error < threshold) break
 5. Else, reduce step size and try again

Particle System Forces

- Force fields
 - Gravity, wind, pressure
- Viscosity/damping
 - Drag, friction
- Collisions
 - Static objects in scene
 - Other particles
- Attraction and repulsion
 - Springs between neighboring particles (mesh)
 - Gravitational pull, charge

Particle System Forces

- Gravity
 - Force due to gravitational pull (of earth)
 - g = acceleration due to gravity (m/s^2)

$$f_g = mg \quad \downarrow \quad g = (0, -9.80665, 0)$$

Particle System Forces

- Drag
 - Force due to resistance of medium
 - k_{drag} = drag coefficient (kg/s)

$$f_d = -k_{\text{drag}} v^2$$

- Air resistance taken as proportional to v^2

Particle System Forces

- Sinks
 - Force due to attractor in scene

$$f_s = \frac{\text{intensity}}{c_a + l_a \cdot d + q_a \cdot d^2}$$

Particle System Forces

- Gravitational pull of other particles
 - Newton's universal law of gravitation

$$f_G = G \frac{m_1 \cdot m_2}{d^2}$$

$$G = 6.67428 \times 10^{-11} \text{ N m}^2 \text{ kg}^{-2}$$

Particle System Forces

- Springs
 - Hooke's law

$$f_H(p) = k_s(d(p, q) - s) D$$

$$D = (q - p) / \|q - p\|$$

$$d(p, q) = \|q - p\|$$

s = resting length

k_s = spring coefficient

Particle System Forces

- Springs
 - Hooke's law with damping

$$f_H(p) = [k_s(d(p, q) - s) + k_d(v(q) - v(p)) \cdot D] D$$

$$D = (q - p) / \|q - p\|$$

$$d(p, q) = \|q - p\|$$

s = resting length

k_s = spring coefficient

k_d = damping coefficient

$v(p)$ = velocity of p

$v(q)$ = velocity of q

$$k_d \sim 2\sqrt{mk_s}$$

Example: Rope

Particle System Forces

- Spring-mass mesh

Example: Cloth

Particle System Forces

- Collisions
 - Collision detection
 - Collision response

Particle System Forces

- Collision detection
 - Intersect ray with scene
 - Compute up to Δt away from time of time of first collision, and then continue from there

Collision Detection

Bounding Volumes

Spatial Partitioning

	1	1	1	2	
	1	1	1	2	
	1	1	2	2	2
1	1	1		2	2

Particle System Forces

- Collision response
 - No friction: elastic collision
(for $m_{\text{target}} \gg m_{text{particle}}$: specular reflection)

- Otherwise, total momentum conserved, energy dissipated if inelastic

Particle System Forces

- Impulse driven
 - Manipulation of velocities
 - Fast, more difficult to compute
- Force driven
 - Penetration induces forces
 - Slow, easy to compute
- Position based response
 - Approximate, non physical
 - Lightweight

Example: Bouncing

Ning Jin
COS 426, 2013

Particle Systems

- For each frame:
 - For each simulation step (Δt)
 - Create new particles and assign attributes
 - Update particles based on attributes and physics
 - Delete any expired particles
 - Render particles

Deleting Particles

- When to delete particles?
 - When life span expires
 - When intersect predefined sink surface
 - Where density is high
 - Random

Particle Systems

- For each frame:
 - For each simulation step (Δt)
 - Create new particles and assign attributes
 - Update particles based on attributes and physics
 - Delete any expired particles
 - Render particles

Rendering Particles

- Rendering styles

- **Points**

- Polygons
 - Shapes
 - Trails
 - etc.

Rendering Particles

- Rendering styles
 - Points
 - Textured polygons: sprites
 - Shapes
 - Trails
 - etc.

Rendering Particles

- Rendering styles
 - Points
 - Polygons
 - Shapes
 - Trails
 - etc.

Rendering Particles

- Rendering styles
 - Points
 - Polygons
 - Shapes
 - Trails
 - etc.

McAllister

Putting it All Together

- Examples
 - Smoke
 - Water
 - Cloth
 - Fire
 - Fireworks
 - Dice

Example: “Smoke”

Lentine

Example: Fire

Example: Cloth

Example: Cloth

Bender

Example: More Bouncing

Bender

Summary

- Particle systems
 - Lots of particles
 - Simple physics
- Interesting behaviors
 - Smoke
 - Cloth
- Solving motion equations
 - For each step, first sum forces, then update position and velocity
