# COS320: Compiling Techniques 

Zak Kincaid

February 23, 2022

- Reminder: HW2 due today
- HW3 on course webpage. Due March 21. Start early!
- You will implement a compiler for a simple imperative programming language (Oat), targeting LLVMlite.
- You may work individually or in pairs
- Midterm next Thursday
- Covers material in lectures up to February 23rd (this Wednesday)
- Interpreters, program transformation, X86, IRs, lexing, parsing
- How to prepare:
- Sample exams on Canvas later today
- Start on HW3
- Review slides
- Review example code from lectures (try re-implementing!)
- Review next Monday: come prepared with questions

## Parsing II: LL parsing

## Recall: Context-free grammars

- A context-free grammar $G=(N, \Sigma, R, S)$ consists of:
- $N$ : a finite set of non-terminal symbols
- $\Sigma$ : a finite alphabet (or set of terminal symbols)
- $R \subseteq N \times(N \cup \Sigma)^{*}$ a finite set of rules or productions
- $S \in N$ : the starting non-terminal.

## Recall: Context-free grammars

- A context-free grammar $G=(N, \Sigma, R, S)$ consists of:
- $N$ : a finite set of non-terminal symbols
- $\Sigma$ : a finite alphabet (or set of terminal symbols)
- $R \subseteq N \times(N \cup \Sigma)^{*}$ a finite set of rules or productions
- $S \in N$ : the starting non-terminal.
- A word $w$ is accepted by $G$ if is derivable in zero or more steps from the starting non-terminal
- Write $\gamma \Rightarrow \gamma^{\prime}$ if $\gamma^{\prime}$ is obtained from $\gamma$ by replacing a non-terminal symbol in $\gamma$ with the right-hand-side of one of its rules
- Write $\gamma \Rightarrow^{*} \gamma^{\prime}$ if $\gamma^{\prime}$ can be obtained from $\gamma$ using $\mathbf{O}$ or more derivation steps
- A word $w \in \Sigma^{*}$ is accepted by $G$ if $S \Rightarrow^{*} w$

## Parsing

- Context-free grammars are generative: easy to find strings that belongs to $\mathcal{L}(G)$, not so easy determine whether a given string belongs to $\mathcal{L}(G)$
- Pushdown automata (PDA) are a kind of automata that recognize context-free languages
- Pushdown automaton recognizing <S> :: \llS><S> | (<S>) | $\epsilon$ :
- Stack alphabet: $\$$ marks bottom of the stack, $L$ marks unbalanced left paren

## Recall: pushdown automata

- A push-down automaton $A=(Q, \Sigma, \Gamma, \Delta, s, F)$ consists of
- $Q$ : a finite set of states
- $\Sigma$ : an (input) alphabet
- $\Gamma$ : a (stack) alphabet
- $\Delta \subseteq \underbrace{Q}_{\text {source }} \times \underbrace{(\Sigma \cup\{\epsilon\})}_{\text {read input }} \times \underbrace{\Gamma^{*}}_{\text {read stack }} \times \underbrace{Q}_{\text {dest }} \times \underbrace{\Gamma^{*}}_{\text {write stack }}$, the transition relation
- $s \in Q$ : start state
- $F \subseteq Q$ : set of final (accepting) states

## Recall: pushdown automata

- A push-down automaton $A=(Q, \Sigma, \Gamma, \Delta, s, F)$ consists of
- $Q$ : a finite set of states
- $\Sigma$ : an (input) alphabet
- $\Gamma$ : a (stack) alphabet
- $\Delta \subseteq \underbrace{Q}_{\text {source }} \times \underbrace{(\Sigma \cup\{\epsilon\})}_{\text {read input }} \times \underbrace{\Gamma^{*}}_{\text {read stack }} \times \underbrace{Q}_{\text {dest }} \times \underbrace{\Gamma^{*}}_{\text {write stack }}$, the transition relation
- $s \in Q$ : start state
- $F \subseteq Q$ : set of final (accepting) states
- A word $w$ is accepted by $A$ if there is a $w$-labeled accepting path in $A$
- A configuration of $A$ is a pair $(q, v)$ consisting of a state $q \in Q$ and a stack $v \in \Gamma^{*}$
- Write $(q, v) \xrightarrow{w}\left(q^{\prime}, v^{\prime}\right)$ if there is some $t \in \Gamma^{*}$ such that $v=a t, v^{\prime}=b t$, and $\left(q, w, a, q^{\prime}, b\right) \in \Delta$
- Write $(q, v) \xrightarrow{w}\left(q^{\prime}, v^{\prime}\right)$ if there is some $w_{1}, \ldots, w_{n}$ and $\left(q_{1}, v_{1}\right), \ldots,\left(q_{n-1}, v_{n-1}\right)$ such that $w=w_{1} \cdots w_{n}$ and

$$
(q, v) \xrightarrow{w_{1}}\left(q_{1}, v_{1}\right) \xrightarrow{w_{2}}\left(q_{2}, v_{2}\right) \xrightarrow{w_{3}} \ldots \xrightarrow{w_{n-1}}\left(q_{n-1}, v_{n-1}\right) \xrightarrow{w_{n}}\left(q^{\prime}, v^{\prime}\right)
$$

- A word $w$ is accepted iff $(s, \epsilon) \xrightarrow{w}(q, a)$ for some $q \in F$.

## Context free languages

- Claim: a language is recognized by a context-free grammar if and only if it is recognized by a pushdown automaton
- Say that a language is context free if it is recognized by a context-free grammar (equiv. pushdown automaton).
- Consequence: can "compile" context-free grammars to pushdown automata in order to implement parsers

## Context free languages

- Claim: a language is recognized by a context-free grammar if and only if it is recognized by a pushdown automaton
- Say that a language is context free if it is recognized by a context-free grammar (equiv. pushdown automaton).
- Consequence: can "compile" context-free grammars to pushdown automata in order to implement parsers
- Two strategies, which correspond to different ways to implement parsers:
- Top-down (LL parsing)
- Bottom-up (LR parsing)

## Top-down parsing

- Stack represents intermediate state of a derivation, minus the consumed part of the input string.
- Start with $S$ on the stack
- Any time top of the stack is a non-terminal $A$, non-deterministically choose a rule $A::=\gamma \in R$. Pop $A$ off the stack, and push $\gamma$
- If the top of the stack is a terminal $a$, consume $a$ from the input string and pop $a$ off the stack
- Accept when stack is empty

$$
\begin{aligned}
& \langle S\rangle::=\langle\mathrm{B}\rangle+\langle\mathrm{S}\rangle \mid\langle\mathrm{B}\rangle \\
& \langle\mathrm{B}\rangle::=(\langle\mathrm{S}\rangle) \mid \mathrm{x}
\end{aligned}
$$

$$
\begin{aligned}
& <\mathrm{S}>::=<\mathrm{B}\rangle+<\mathrm{S}>|<\mathrm{B}\rangle \\
& <B>::=(\langle S\rangle) \mid x \\
& \text { (, }(\rightarrow \epsilon \\
& \text { ), ) } \rightarrow \epsilon \\
& +,+\rightarrow \epsilon \\
& \mathrm{x}, \mathrm{x} \rightarrow \epsilon
\end{aligned}
$$

| State | Stack | Input |
| :---: | :---: | :---: |
| $q_{0}$ | $\epsilon$ | $(x+x)+x$ |
| $q_{1}$ | <S>\$ | $(x+x)+x$ |
| $q_{1}$ | <B>+<S>\$ | $(x+x)+x$ |
| $q_{1}$ | (<S>) $+<\mathrm{S}>\$$ | $(x+x)+x$ |
| $q_{1}$ | <S>)+<S>\$ | x+x)+x |
| $q_{1}$ | <B>+<S>)+<S>\$ | x+x) +x |
| $q_{1}$ | $\mathrm{x}+\langle$ S $>$ ) $+\langle\mathrm{S}>\$$ | $x+x)+x$ |
| $q_{1}$ | +<S>)+<S>\$ | $+x)+x$ |
| $q_{1}$ | <S>)+<S>\$ | $x)+x$ |
| $q_{1}$ | <B>)+<S>\$ | $x)+x$ |
| $q_{1}$ | x) $+<$ S $>\$$ | $x)+x$ |
| $q_{1}$ | )+<S>\$ | )+x |
| $q_{1}$ | +<S>\$ | +x |
| $q_{1}$ | <S>\$ | x |
| $q_{1}$ | <B>\$ | x |
| $q_{1}$ | $\times \$$ | x |
| $q_{1}$ | \$ | $\epsilon$ |
| $q_{f}$ | $\epsilon$ | $\epsilon$ |

## Bottom-up parsing

- Stack holds a word in $(N \cup \Sigma)^{*}$ such that it is possible to derive the part of the input string that has been consumed from its reverse.
- At any time, may read a letter from input string and push it on top of the stack
- At any time, may non-deterministically choose a rule $A::=\gamma_{1} \ldots \gamma_{n}$ and apply it in reverse: pop $\gamma_{n} \ldots \gamma_{1}$ off the top of the stack, and push $A$.
- Accept when stack just contains start non-terminal

$$
\begin{aligned}
& \langle S\rangle::=\langle\mathrm{B}\rangle+\langle\mathrm{S}\rangle|<\mathrm{B}\rangle \\
& <\mathrm{B}\rangle::=(\langle\mathrm{S}\rangle) \mid \mathrm{x}
\end{aligned}
$$

$$
\begin{aligned}
& <\mathrm{S}\rangle::=<\mathrm{B}\rangle+\langle\mathrm{S}\rangle|<\mathrm{B}\rangle \\
& <\mathrm{B}\rangle::=(\langle\mathrm{S}\rangle) \mid \mathrm{x} \\
& (, \epsilon \rightarrow \text { ( } \\
& \text { ), } \epsilon \rightarrow \text { ) } \\
& +, \epsilon \rightarrow+ \\
& \mathrm{x}, \epsilon \rightarrow \mathrm{x} \\
& \begin{array}{c}
\epsilon, \epsilon \rightarrow \$ \\
\epsilon,<\mathrm{S}>+<\mathrm{B}>\rightarrow<\mathrm{S}> \\
\epsilon,<\mathrm{B}>\rightarrow<\mathrm{S}> \\
\epsilon,)<\mathrm{S}>(\rightarrow<\mathrm{B}> \\
\epsilon, \mathrm{x} \rightarrow<\mathrm{B}>
\end{array}
\end{aligned}
$$

| State | Stack | Input |
| :---: | :---: | :---: |
| $q_{0}$ | $\epsilon$ | ( $\mathrm{x}+\mathrm{x}$ ) +x |
| $q_{1}$ | \$ | $(x+x)+x$ |
| $q_{1}$ | (\$ | $x+x)+x$ |
| $q_{1}$ | $\times$ (\$ | $+x)+x$ |
| $q_{1}$ | <B> (\$ | $+x)+x$ |
| $q_{1}$ | +<B> (\$ | $x)+x$ |
| $q_{1}$ | $x+<B>$ (\$ | )+x |
| $q_{1}$ | $<B>+<B>$ (\$ | )+x |
| $q_{1}$ | $\langle\mathrm{S}\rangle+\langle\mathrm{B}>$ (\$ | )+x |
| $q_{1}$ | <S> (\$ | )+x |
| $q_{1}$ | )<S>(\$ | +x |
| $q_{1}$ | <B>\$ | +x |
| $q_{1}$ | $+<B>\$$ | x |
| $q_{1}$ | $x+<B>\$$ | $\epsilon$ |
| $q_{1}$ | $<B>+<B>\$$ | $\epsilon$ |
| $q_{1}$ | <S>+<B>\$ | $\epsilon$ |
| $q_{1}$ | <S>\$ | $\epsilon$ |
| $q_{f}$ | $\epsilon$ | $\epsilon$ |

## Parsing overview

- Basic problem with both top-down and bottom-up construction: non-determinism
- Non-deterministic search is inefficient
- E.g., consider <S> : := <S>a | <S>b | $\epsilon$. Top-down parser must "guess" the entire input string at the beginning (breadth-first backtracking search takes exponential time in length of input string, depth-first does not terminate).
- Algorithms for parsing any context free grammar in cubic ${ }^{1}$ time, based on dynamic programming (Earley, and Cocke-Younger-Kasami).

[^0]
## Parsing overview

- Basic problem with both top-down and bottom-up construction: non-determinism
- Non-deterministic search is inefficient
- E.g., consider $\langle S\rangle$ : := <S>a | <S>b | $\epsilon$. Top-down parser must "guess" the entire input string at the beginning (breadth-first backtracking search takes exponential time in length of input string, depth-first does not terminate).
- Algorithms for parsing any context free grammar in cubic ${ }^{1}$ time, based on dynamic programming (Earley, and Cocke-Younger-Kasami).
- Parser generators use these same ideas, but restricted to cases where we can eliminate non-determinism.
- Possible for both top-down and bottom-up style
- Today: LL (Left-to-right, Leftmost derivation) parsers: top-down
- Easy to understand \& write by hand
- Next time: $L R$ (Left-to-right, Rightmost derivation) parsers: bottom-up
- More general, (variations) implemented in parser generators

[^1]
## LL parsing

$$
\begin{aligned}
& \langle\mathrm{S}\rangle::=\langle\mathrm{B}\rangle+\langle\mathrm{S}\rangle \mid\langle\mathrm{B}\rangle \\
& \langle\mathrm{B}\rangle::=(\langle\mathrm{S}\rangle) \mid \mathrm{x}
\end{aligned}
$$

- "Any time top of the stack is a non-terminal $A$, non-deterministically choose a production $A::=\gamma \in R$. Pop $A$ off the stack, and push $\gamma$ "
- Key problem: need to deterministically choose which production to use
- Solution: Look at the next input symbol, but don't consume it (lookahead)
- This is $L L(1)$ parsing. $L L(k)$ allows $k$ lookahead tokens
- We say that a grammar is $L L(k)$ if when we look ahead $k$ symbols in a top-down parser, we know which rule we should apply.
- Let $G=(N, \Sigma, R, S)$ be a grammar. $G$ is $L L(k)$ iff: for any $S \Rightarrow^{*} \alpha A \beta$, for any word $w \in \Sigma^{k}$, if there is some $A::=\gamma \in R$ such that $\gamma \beta \Rightarrow^{*} w \beta^{\prime}$ (for some $\beta^{\prime}$ ), then $\gamma$ is unique.
- Not every context-free language has an $L L(k)$ grammar.
- $\left\{a^{i} b^{j}: i=j \vee 2 i=j\right\}$ is not $L L(k)$ for any $k$
- Which of the following are $L L(1)$ grammars?
- <S> ::= $\mathrm{a}<\mathrm{S}>|\mathrm{b}<\mathrm{S}>| \epsilon$
- <S> ::= <S>a| <S>b| $\epsilon$
- <S> ::= <B>+<S>|<B> $\langle B\rangle::=(\langle S\rangle) \mid x$
- We say that a grammar is $L L(k)$ if when we look ahead $k$ symbols in a top-down parser, we know which rule we should apply.
- Let $G=(N, \Sigma, R, S)$ be a grammar. $G$ is $L L(k)$ iff: for any $S \Rightarrow^{*} \alpha A \beta$, for any word $w \in \Sigma^{k}$, if there is some $A::=\gamma \in R$ such that $\gamma \beta \Rightarrow^{*} w \beta^{\prime}$ (for some $\beta^{\prime}$ ), then $\gamma$ is unique.
- Not every context-free language has an $L L(k)$ grammar.
- $\left\{a^{i} b^{j}: i=j \vee 2 i=j\right\}$ is not $L L(k)$ for any $k$
- Which of the following are $L L(1)$ grammars?
- <S> ::= a<S> |b<S> | $\epsilon$

More generally, any grammar that results from our DFA $\rightarrow$ CFG conversion

- <S> ::= <S>a| <S>b| $\epsilon$
- <S> ::= <B>+<S> | <B>
$\langle B\rangle::=(\langle S\rangle) \mid x$

## Left-factoring

- The grammar

$$
\begin{aligned}
& \langle\mathrm{S}\rangle::=\langle\mathrm{B}\rangle+\langle\mathrm{S}\rangle \mid\langle\mathrm{B}\rangle \\
& \langle\mathrm{B}\rangle::=(\langle\mathrm{S}\rangle) \mid \mathrm{x}
\end{aligned}
$$

is not LL(1): (lookahead can't distinguish the two <S> rules

- However, there is an $\operatorname{LL}(1)$ grammar for the language

## Left-factoring

- The grammar

$$
\begin{aligned}
& \langle S\rangle::=\langle B\rangle+\langle S\rangle \mid\langle B\rangle \\
& \langle B\rangle::=(\langle S\rangle) \mid x
\end{aligned}
$$

is not LL(1): (lookahead can't distinguish the two <S> rules

- However, there is an $\operatorname{LL}(1)$ grammar for the language

$$
\begin{aligned}
& \langle S\rangle::=\langle B\rangle<R> \\
& \langle R\rangle::=+\langle S\rangle \mid \epsilon \\
& \langle B\rangle::=(\langle S\rangle) \mid x
\end{aligned}
$$

- General strategy: factor out rules with common prefixes ("left factoring")

## Eliminating left recursion

- A grammar is left-recursive if there is a non-terminal $A$ such that $A \Rightarrow^{+} A \gamma$ (for some $\gamma$ )
- Left-recursive grammars are not $L L(k)$ for any $k$
- Consider:

$$
\begin{aligned}
& \langle S\rangle::=\langle S\rangle+\langle B\rangle|<B\rangle \\
& \langle B\rangle::=(\langle S\rangle) \mid x
\end{aligned}
$$

## Eliminating left recursion

- A grammar is left-recursive if there is a non-terminal $A$ such that $A \Rightarrow^{+} A \gamma$ (for some $\gamma$ )
- Left-recursive grammars are not $L L(k)$ for any $k$
- Consider:

$$
\begin{aligned}
& \langle S\rangle::=\langle\mathrm{S}\rangle+\langle\mathrm{B}\rangle|<\mathrm{B}\rangle \\
& \langle\mathrm{B}\rangle::=(\langle\mathrm{S}\rangle) \mid \mathrm{x}
\end{aligned}
$$

Can remove left recursion as follows:

$$
\begin{aligned}
&\langle\mathrm{S}\rangle: \\
&\left\langle\mathrm{S}^{\prime}\right\rangle\left.::=+\mathrm{B}\rangle\langle\mathrm{~S}\rangle><\mathrm{S}^{\prime}\right\rangle \mid \epsilon \\
&\langle\mathrm{B}\rangle: \\
&=(\langle\mathrm{S}\rangle) \mid \mathrm{x}
\end{aligned}
$$

(Recognizes the same language, but parse trees are different!)

## Mechanical construction of $\mathrm{LL}(1)$ parsers

- Fix a grammar $G=(N, \Sigma, R, S)$
- For any word $\gamma \in(N \cup \Sigma)^{*}$, define first $(\gamma)=\left\{a \in \Sigma: \gamma \Rightarrow^{*} a w\right\}$
- For any word $\gamma \in(N \cup \Sigma)^{*}$, say that $\gamma$ is nullable if $\gamma \Rightarrow^{*} \epsilon$
- For any non-terminal $A$, define follow $(A)=\left\{a \in \Sigma: \exists \gamma, \gamma^{\prime} . S \Rightarrow \gamma A a \gamma^{\prime}\right\}$

## Mechanical construction of LL(1) parsers

- Fix a grammar $G=(N, \Sigma, R, S)$
- For any word $\gamma \in(N \cup \Sigma)^{*}$, define first $(\gamma)=\left\{a \in \Sigma: \gamma \Rightarrow^{*} a w\right\}$
- For any word $\gamma \in(N \cup \Sigma)^{*}$, say that $\gamma$ is nullable if $\gamma \Rightarrow^{*} \epsilon$
- For any non-terminal $A$, define follow $(A)=\left\{a \in \Sigma: \exists \gamma, \gamma^{\prime} . S \Rightarrow \gamma A a \gamma^{\prime}\right\}$
- Transition table $\delta$ for $G$ can be computed using first, follow, and nullable:
(1) For each non-terminal $A$ and letter $a$, initialize $\delta(A, a)$ to $\emptyset$
(2) For each rule $A::=\gamma$
- Add $\gamma$ to $\delta(A, a)$ for each $a \in \operatorname{first}(\gamma)$
- If $\gamma$ is nullable, add $\gamma$ to $\delta(A, a)$ for each $a \in$ follow $(A)$

## Mechanical construction of LL(1) parsers

- Fix a grammar $G=(N, \Sigma, R, S)$
- For any word $\gamma \in(N \cup \Sigma)^{*}$, define $\operatorname{first}(\gamma)=\left\{a \in \Sigma: \gamma \Rightarrow^{*} a w\right\}$
- For any word $\gamma \in(N \cup \Sigma)^{*}$, say that $\gamma$ is nullable if $\gamma \Rightarrow^{*} \epsilon$
- For any non-terminal $A$, define follow $(A)=\left\{a \in \Sigma: \exists \gamma, \gamma^{\prime} . S \Rightarrow \gamma A a \gamma^{\prime}\right\}$
- Transition table $\delta$ for $G$ can be computed using first, follow, and nullable:
(1) For each non-terminal $A$ and letter $a$, initialize $\delta(A, a)$ to $\emptyset$
(2) For each rule $A::=\gamma$
- Add $\gamma$ to $\delta(A, a)$ for each $a \in \operatorname{first}(\gamma)$
- If $\gamma$ is nullable, add $\gamma$ to $\delta(A, a)$ for each $a \in$ follow $(A)$
- $G$ is $L L(1)$ iff $\delta(A, a)$ is empty or singleton for all $A$ and $a$

## Mechanical construction of LL(1) parsers

- Fix a grammar $G=(N, \Sigma, R, S)$
- For any word $\gamma \in(N \cup \Sigma)^{*}$, define first $(\gamma)=\left\{a \in \Sigma: \gamma \Rightarrow^{*} a w\right\}$
- For any word $\gamma \in(N \cup \Sigma)^{*}$, say that $\gamma$ is nullable if $\gamma \Rightarrow^{*} \epsilon$
- For any non-terminal $A$, define follow $(A)=\left\{a \in \Sigma: \exists \gamma, \gamma^{\prime} . S \Rightarrow \gamma A a \gamma^{\prime}\right\}$
- Transition table $\delta$ for $G$ can be computed using first, follow, and nullable:
(1) For each non-terminal $A$ and letter $a$, initialize $\delta(A, a)$ to $\emptyset$
(2) For each rule $A::=\gamma$
- Add $\gamma$ to $\delta(A, a)$ for each $a \in \operatorname{first}(\gamma)$
- If $\gamma$ is nullable, add $\gamma$ to $\delta(A, a)$ for each $a \in$ follow $(A)$
- $G$ is $L L(1)$ iff $\delta(A, a)$ is empty or singleton for all $A$ and $a$
- Operation of the parser on a word $w$ :
- Start with stack <S>
- While $w$ not empty
- If top of the stack is a terminal $a$ and $w=a w^{\prime}$, pop and set $w=w^{\prime}$
- If top of the stack is a non-terminal $A$ and $w=a w^{\prime}$, pop and push (singleton) $\delta(A, w)$ (or reject if $\delta(A, w)$ is empty)
- Accept if stack is empty; reject otherwise.

## Computing nullable

- nullable is the smallest set of non-terminals such that if there is some $A::=\gamma_{1} \ldots \gamma_{n} \in R$ with $\gamma_{1}, \ldots, \gamma_{n} \in$ nullable implies $A \in$ nullable
- Fixpoint computation:
- nullable ${ }_{0}=\emptyset$
- nullable $_{i+1}=\left\{A: \exists \gamma_{1}, \ldots, \gamma_{n} \in\right.$ nullable $\left._{i . A}::=\gamma_{1} \ldots \gamma_{n} \in R\right\}$
- nullable $=\bigcup_{i=0}^{\infty}$ nullable $_{i}$
nullable $\leftarrow \emptyset$;
changed $\leftarrow$ true;
while changed do
changed $\leftarrow$ false;
for $A:=\gamma_{1} \ldots \gamma_{n} \in R$ do
if $A \notin$ nullable $\wedge \gamma_{1}, \ldots, \gamma_{n} \in$ nullable then
nullable $\leftarrow$ nullable $\cup\{A\}$;
changed $\leftarrow$ true;

## Computing nullable

- nullable is the smallest set of non-terminals such that if there is some $A::=\gamma_{1} \ldots \gamma_{n} \in R$ with $\gamma_{1}, \ldots, \gamma_{n} \in$ nullable implies $A \in$ nullable
- Fixpoint computation:
- nullable ${ }_{0}=\emptyset$
- nullable $e_{i+1}=\left\{A: \exists \gamma_{1}, \ldots, \gamma_{n} \in\right.$ nullable $\left._{i} . A::=\gamma_{1} \ldots \gamma_{n} \in R\right\}$
- nullable $=\bigcup_{i=0}^{\infty}$ nullable $_{i}$
nullable $\leftarrow \emptyset$;
changed $\leftarrow$ true;
while changed do
changed $\leftarrow$ false;
for $A:=\gamma_{1} \ldots \gamma_{n} \in R$ do
if $A \notin$ nullable $\wedge \gamma_{1}, \ldots, \gamma_{n} \in$ nullable then
nullable $\leftarrow$ nullable $\cup\{A\}$;
changed $\leftarrow$ true;
- Fixpoint computations appear everywhere!
- Later we will see how they are used in dataflow analysis

## Computing first and follow

- first is the smallest function ${ }^{2}$ such that
- For each $a \in \Sigma, \operatorname{first}(a)=\{a\}$
- For each $A::=\gamma_{1} \ldots \gamma_{i} \ldots \gamma_{n} \in R$, with $\gamma_{1}, \ldots, \gamma_{i-1}$ nullable, first $(A) \supseteq$ first $\left(\gamma_{i}\right)$
- follow is the smallest function such that
- For each $A::=\gamma_{1} \ldots \gamma_{i} \ldots \gamma_{n} \in R$, with $\gamma_{i+1}, \ldots, \gamma_{n}$ nullable, follow $\left(\gamma_{i}\right) \supseteq$ follow $(A)$
- For each $A::=\gamma_{1} \ldots \gamma_{i} \ldots \gamma_{j} \ldots \gamma_{n} \in R$, with $\gamma_{i+1}, \ldots, \gamma_{j-1}$ nullable, follow $\left(\gamma_{i}\right) \supseteq$ first $\left(\gamma_{j}\right)$
- Both can be computed using a fixpoint algorithm, like nullable
