

# Server-Side Web Programming: CGI (Part 2)

Copyright © 2022 by  
Robert M. Dondero, Ph.D.  
Princeton University

## Objectives

- . We will cover...
  - CGI programming review
  - The HTTP GET method vs. the HTTP POST method

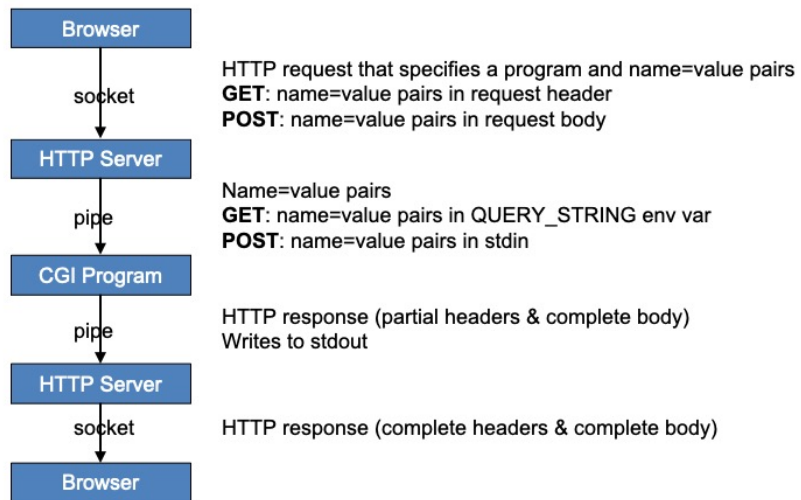

# Agenda

- **CGI Review**
- GET vs. POST

## CGI Review

- **Common Gateway Interface (CGI)**
  - The oldest and simplest way to implement a Web app that generates content dynamically

# CGI Review

## CGI Review: GET vs. POST

- To command browser to issue a HTTP **GET** request:
  - (1) Enter URL at top of browser
  - (2) Click on page link
  - (3) Submit a form whose method="get"
- To command browser to issue a HTTP **POST** request:
  - (1) Submit a form whose method="post"

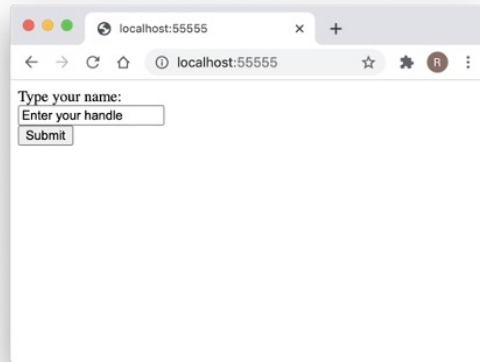

## CGI Review: GET Method

- See **HelloPythonGet** app

```
$ python runserver.py 55555  
Serving HTTP on 0.0.0.0 port 55555 (http://0.0.0.0:55555/) ...
```

## CGI Review: GET Method

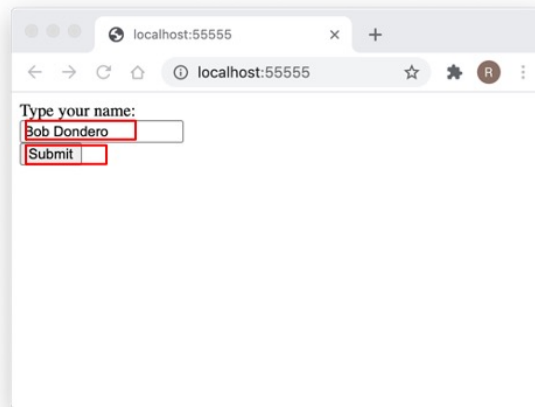

- See **HelloPythonGet** app

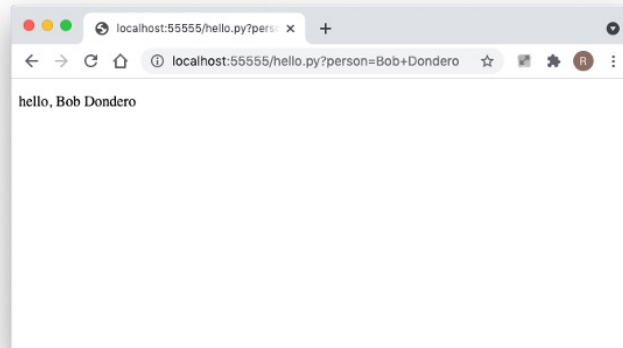

## CGI Review: GET Method

- See **HelloPythonGet** app

## CGI Review: GET Method

- See **HelloPythonGet** app

## CGI Review: GET Method

- See **HelloPythonGet** app (cont.)
  - **runserver.py**
  - **index.html**
    - The default file
  - **hello.py**

11

### CGI Using GET

[see slide]

Code notes: runserver.py

Launches simplehttpserver.py with the --cgi argument

When simplehttpserver.py sees a request for a .py file...

It interprets that request as a CGI request

I'll create a runserver.py file for every web app

So I (and you) need not remember how to launch the HTTP server

Code notes: index.html

simplehttpserver.py considers index.html to be the default file

If HTTP request doesn't name a file, the file defaults to index.html

Defines a form

Submitting the form will send a HTTP GET request for hello.py with name=value pair person=[whatever the user enters]

Code notes: hello.py

Uses Python environ variable (a dict object) to get the value of the QUERY\_STRING environment variable

Fetches name/value pairs from QUERY\_STRING environment variable  
Composes HTTP response  
Writes it to stdout

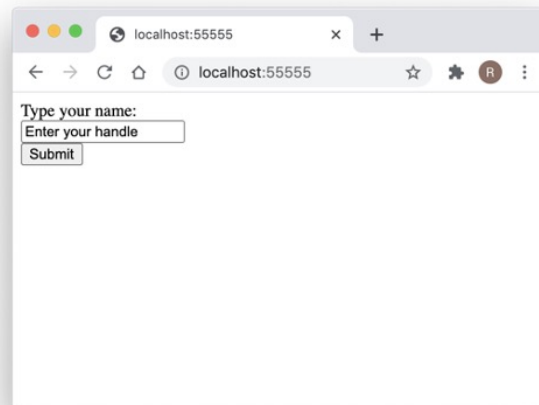

## CGI Review: POST Method

- See **HelloPythonPost** app

```
$ python runserver.py 55555  
Serving HTTP on 0.0.0.0 port 55555 (http://0.0.0.0:55555/) ...
```

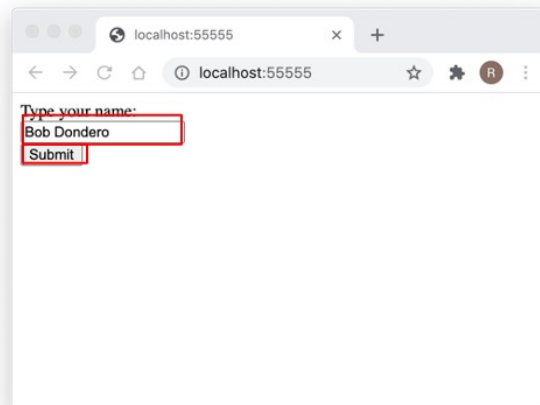

## CGI Review: POST Method

- See **HelloPythonPost** app

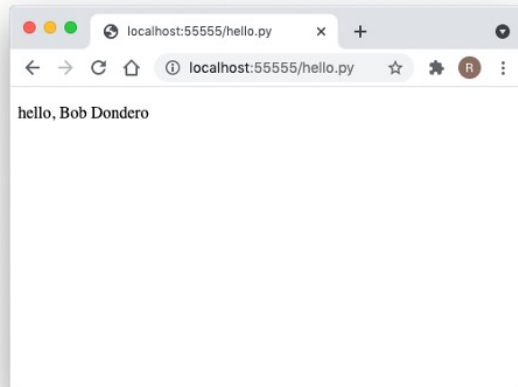

## CGI Review: POST Method

- See **HelloPythonPost** app

## CGI Review: POST Method

- See **HelloPythonPost** app

## CGI Review: POST Method

- See **HelloPythonPost** app (cont.)
  - runserver.py
  - **index.py**
  - **hello.py**

16

### CGI Using POST

[see slide]

Code notes: index.py

Form will submit a POST request

Code notes: hello.py

Fetches name=value pairs from its stdin, not from an env var

## Agenda

- Review: CGI
- **GET vs. POST**

17

### **GET vs POST**

Let's again sharply contrast the two HTTP methods...  
And also cover when you should use one vs. the other

## GET vs. POST

- When to use **GET**?
- When to use **POST**?

18

### GET vs. POST

[see slide]

The GET and POST methods have the same power  
When should you use GET? POST?

## GET vs. POST

- Technical criteria
  - Some HTTP servers reject long headers
  - Use **POST** when:
    - There are very many name=value pairs
    - Some name=value pairs are very long

19

### GET vs. POST

#### Technical criteria

The HTTP spec defines no header size limits, but...

Some HTTP servers reject long headers

Apache: 8K limit

Microsoft IIS: 16K limit

If there are very many name=value pairs, or some name=value pairs are very long, then

They might not fit in the request header

You might not be able to use GET

You might need to use POST

## GET vs. POST

- Convention:
  - Use **GET** if request is *idempotent*
    - Processing the same request twice has the **same** server-side effect as does processing the request once
  - Use **POST** if request is *not idempotent*
    - Processing the same request twice has a **different** server-side effect from processing the request once

20

### GET vs. POST

Oxford dictionary:

**Idempotent:** denoting an element of a set which is unchanged in value when multiplied or otherwise operated on by itself

[see slide]

## GET vs. POST

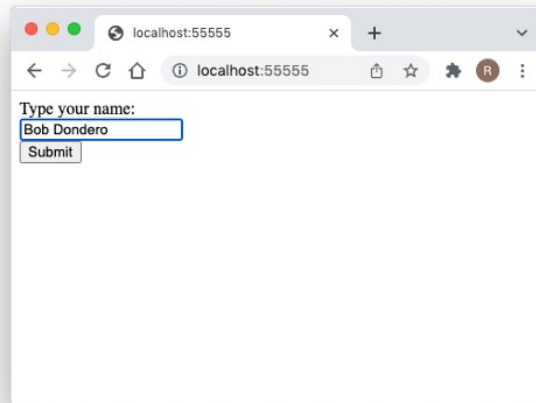

- Convention:
  - **Example:** HTTP request asks for car price
    - Processing the request twice = processing the request once
    - Request is **idempotent**
    - Request should use **GET**
  - **Example:** HTTP request purchases a car
    - Processing the request twice != processing the request once
    - Request is **not idempotent**
    - Request should use **POST**

## GET vs. POST

- With that convention...
- Browser has sent **GET** request =>
  - Browser assumes request was **idempotent**
  - Browser **does not warn** about page refresh
- Browser has sent **POST** request =>
  - Browser assumes request was **not idempotent**
  - Browser **warns** about page refresh

# GET vs. POST

## . **Example:** HelloPythonGet

# GET vs. POST

## . **Example:** HelloPythonGet (cont.)

Reload  
this  
page

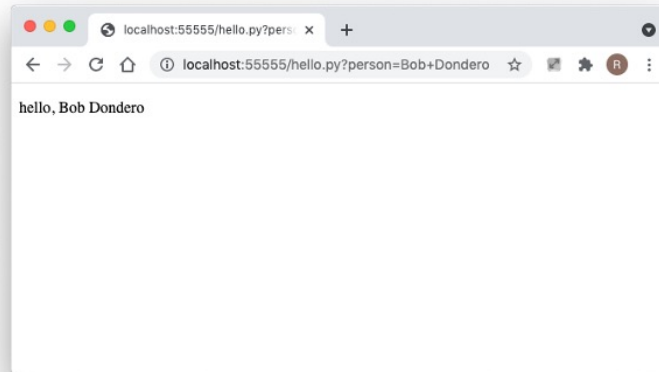

24

## GET vs POST

The HTTP request that yielded the current page was a GET request  
So the browser assumes the request was idempotent

# GET vs. POST

## . **Example:** HelloPythonGet (cont.)

No  
warning

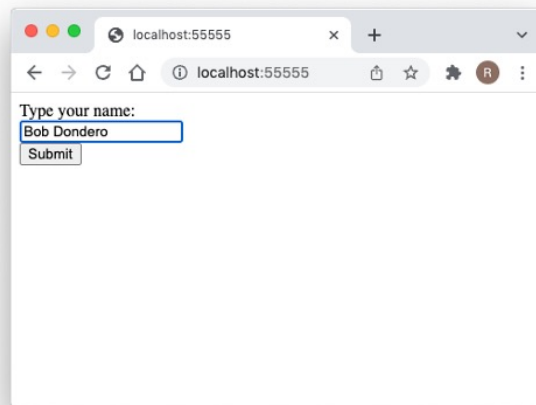

25

## GET vs POST

So a page reload (causing the browser to send the same HTTP request) generates no browser warning

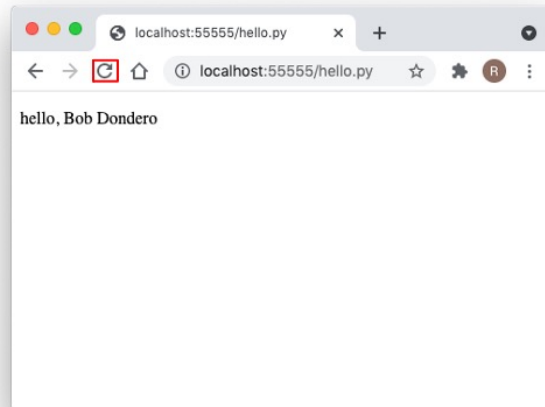

# GET vs. POST

## . **Example:** HelloPythonPost

# GET vs. POST

## . Example: HelloPythonPost (cont.)

Reload  
this  
page

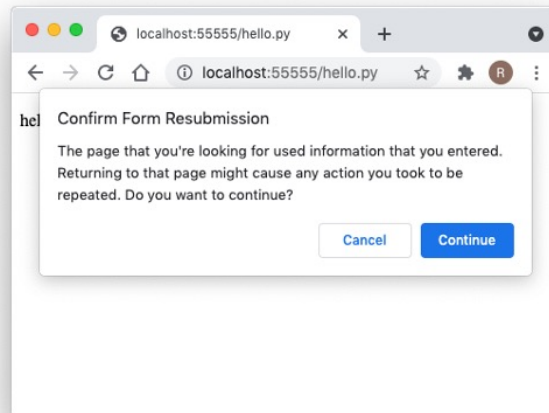

27

## GET vs POST

The HTTP request that yielded the current page was a POST request  
So the browser assumes the request was not idempotent

# GET vs. POST

## . Example: HelloPythonPost (cont.)

Warning!

28

## GET vs POST

So a page reload (causing the browser to send the same HTTP request) generates a browser warning

## GET vs. POST

- . Generally:
  - Use **GET** to **retrieve** server-side state
  - Use **POST** to **change** server-side state

## Aside: HTTP Methods

A more complete set of HTTP methods:

Method	Conventional Purpose	Idempotent?	simplehttpserver.py Handles?
<b>GET</b>	Retrieve resource	Yes	Yes
<b>POST</b>	Create resource	No	Yes
<b>PUT</b>	Replace resource	Yes	No
<b>PATCH</b>	Update resource	No	No
<b>DELETE</b>	Delete resource	Yes	No

Others: **CONNECT, HEAD, OPTIONS, TRACE**

See Chapter 14 of *Flask Web Development*  
by Miguel Grinberg

30

### Aside: HTTP Methods

[see slide]

An application that uses HTTP, and uses the HTTP methods for their conventional purposes, is said to be RESTful

## Summary

- We have covered:
  - CGI programming review
  - GET vs. POST
