Software Engineering (Part 4)

Robert M. Dondero, Ph.D.
Princeton University

Objectives

- You will learn/review these software engineering topics:
  - Requirements analysis
  - Design
  - Implementation
  - Debugging
  - Testing
  - Evaluation
  - Maintenance
  - Process models

Stages of SW dev

How to order the stages

Objectives

Software Engineering lectures:

Part 1	Requirements analysis Design (general)
Part 2	Design (object-oriented) Implementation Debugging
Part 3	Testing Evaluation
Part 4	**Maintenance** **Process models**

So the system is finished. Or is it?

Agenda

- Requirements analysis
- Design
- Implementation
- Debugging
- Testing
- Evaluation
- **Maintenance**
- Process models

Maintenance

- ***Maintenance***
  - Alias ***continuance***
  - How can I ensure that the system continues to fulfill the users' needs through time?

Maintenance

- ***Perfective maintenance***
  - Add new features, improve (performance of) existing features
  - Analyze **execution profiles**
- ***Adaptive maintenance***
  - Modify the system to meet changes in its environment
- ***Corrective maintenance***
  - Fix bugs
- ***Preventive maintenance***
  - **Refactor code** to make it more maintainable

- First **profiling**, then **refactoring**...

Rod Stephens.
Beginning Software Engineering.
Wiley. 2015

Maintenance: Profiling

- Tool support for profiling
  - **Python**: ***cProfile*** module
    - Example...

Maintenance: Profiling

- See **profiling1/concord.py**
  - (Almost) from Python Language (Part 5) lecture
- See **profiling1/writeprofile.py**
  - Helper program
- See **profiling1/buildandrun**
  - Bash shell script (Mac and Linux)
- See **profiling1/buildandrun.bat**
  - DOS script (MS Windows)

Maintenance: Profiling

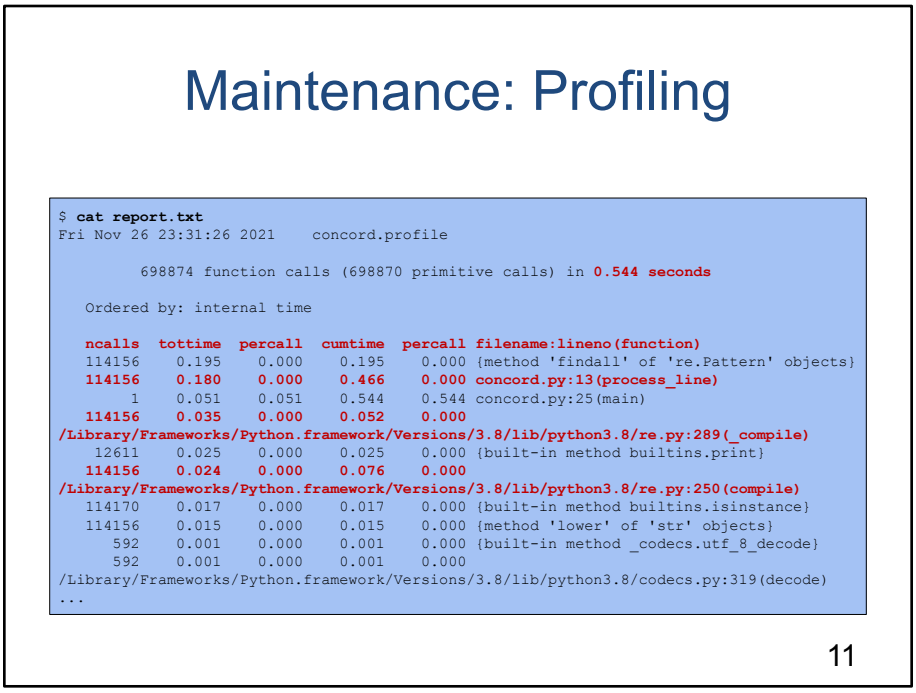
```
$ cd profiling1
$ ./buildandrun

# Create concord.profile
python -m cProfile -o concord.profile concord.py < Bible.txt
welcome: 1
to: 13569
you: 2621
have: 3905
arrived: 3
at: 1571
a: 8178
plain: 76
text: 1
...
```

```
…
alleluia: 4
omnipotent: 1
chalcedony: 1
sardonyx: 1
chrysolyte: 1
chrysoprasus: 1
transparent: 1
proceeding: 1

# Generate the report
python writeprofile.py concord.profile > report.txt

# To view the report examine the contents of report.txt
$
```



Maintenance: Profiling

[see slide]

Previous version: 0.441 seconds

Maintenance: Profiling

- See **profiling2/concord.py**
  - From *Python Programming (Part 5)* lecture
- See profiling2/writeprofile.py
  - Helper program
- See profiling2/buildandrun
  - Bash shell script (Mac and Linux)
- See profiling2/buildandrunslow.bat
  - DOS script (MS Windows)

Maintenance: Profiling

```
$ cd profiling2
$ ./buildandrun

# Create concord.profile
python -m cProfile -o concord.profile concord.py < Bible.txt
welcome: 1
to: 13569
you: 2621
have: 3905
arrived: 3
at: 1571
a: 8178
plain: 76
text: 1
...
```

```
…
alleluia: 4
omnipotent: 1
chalcedony: 1
sardonyx: 1
chrysolyte: 1
chrysoprasus: 1

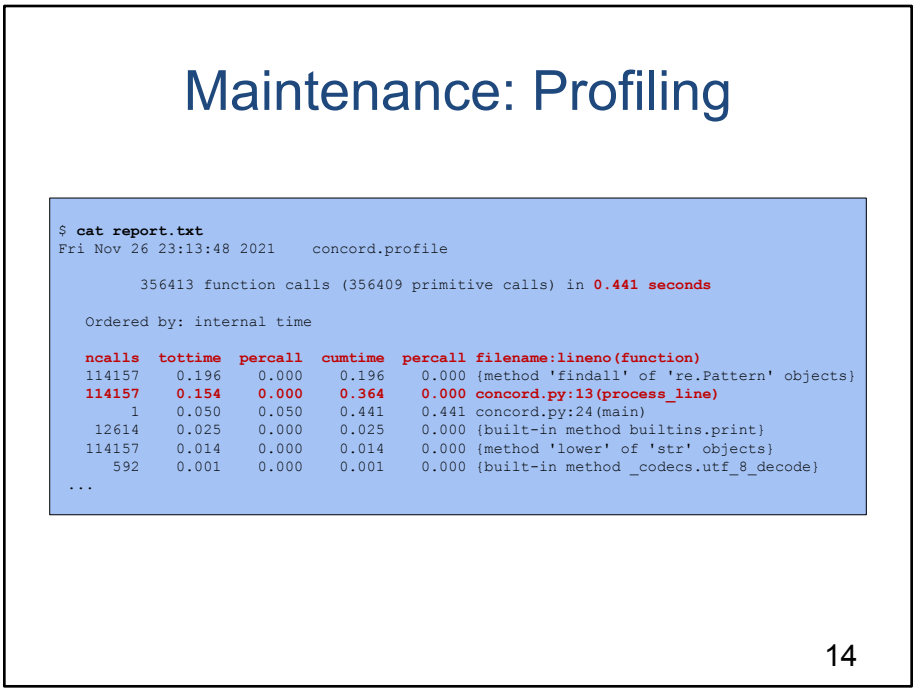
proceeding: 1

# Generate the report
python writeprofile.py concord.profile > report.txt

# To view the report examine the contents of report.txt
$
```



Maintenance: Profiling

[see slide]

Previous CPU time consumed was 0.544 seconds

Aside: Which concord.py?

- Which concord.py is better?
- Observations:
  - **Version 1** has:
    - Better modularity
    - Weaker function-level coupling
    - (Arguably) better **clarity**
    - By a **small** margin

Aside: Which concord.py?

- Which concord.py is better (cont.)?
- Observations:
  - **Version 2** has:
    - Better **performance**
    - By a **large** margin
      - Could matter is stdin is large
- Generally: clarity supersedes performance
- Here: I chose performance

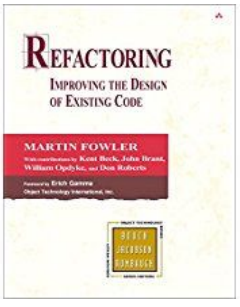
Maintenance: Profiling Tools

Language	Profiling Tool
Python	*cProfile*
Java	*hprof* & *JPerfAnal* *
C (x86-64 or ARM)	*gprof* *
C (x86-64)	*OProfile* *
JavaScript (browser)	*Chrome Developer Tools* *Firefox Performance Tool*
JavaScript (Node.js)	*Node.js profiler*

* See me if you want an example

Maintenance: Refactoring

Martin Fowler



2000

Maintenance: Refactoring

- ***Bad smells*** in code

Martin Fowler.
Refactoring: Improving the Design of Existing Code.
Addison-Wesley. New York. 2000.

Duplicated code	Speculative generality
Long method	Temporary field
Long parameter list	Message chains
Divergent change	Middle man
Shotgun surgery	**Inappropriate intimacy**
Feature envy	Alternative classes with diff interfaces
Data clumps	Incomplete library class
Primitive obsession	**Data class**
Switch statements	**Refused bequest**
Parallel inheritance hierarchies	**Comments**
Lazy class	

Maintenance: Refactoring

1. Composing methods (9)
- Extract method
- Inline method
- Inline temp
- Replace temp with query
- Introduce explaining variable
- Split temporary variable
- Remove assignments to parameters
- Replace method with method object
- Substitute algorithm

2. Moving features between objects (8)
- Move method
- Move field
- Extract class
- Inline class
- Hide delegate
- Remove middle man
- Introduce foreign method
- Introduce local extension

Martin Fowler.
Refactoring: Improving the Design of Existing Code.
Addison-Wesley. New York. 2000.

Maintenance: Refactoring

3. Organizing data (16)
- Self encapsulate field
- Replace data value with object
- Change value to reference
- Change reference to value
- Replace array with object
- Duplicate observed data
- Change unidirectional association to bidirectional
- Change bidirectional association to unidirectional
- Replace magic number with symbolic constant
- Encapsulate field
- Encapsulate collection
- Replace record with data class
- Replace record with class data
- **Replace type code with subclasses**
- Replace type code with state/strategy
- Replace subclass with fields

4. Simplifying conditional expressions (8)
- Decompose conditional
- Consolidate conditional expression
- Consolidate duplicate conditional fragments
- Remove control flag
- Replace nested conditional with guard clauses
- Replace conditional with polymorphism
- Introduce null object
- Introduce assertion

Martin Fowler.
Refactoring: Improving the Design of Existing Code.
Addison-Wesley. New York. 2000.

Maintenance: Refactoring

5. Making method calls simpler (15)
- Rename method
- Add parameter
- Remove parameter
- Separate query from modifier
- Parameterize method
- Replace parameter with explicit methods
- Preserve whole object
- Replace parameter with method
- Introduce parameter object
- Remove setting method
- Hide method
- Replace constructor with factory method
- Encapsulate downcast
- Replace error code with exception
- Replace Exception with test

6. Dealing with generalization (12)
- Pull up field
- Pull up method
- Pull up constructor body
- Push down method
- Push down field
- Extract subclass
- Extract superclass
- Extract Interface
- Collapse hierarchy
- Form template method
- Replace inheritance with delegation
- Replace delegation with inheritance

Martin Fowler.
Refactoring: Improving the Design of Existing Code.
Addison-Wesley. New York. 2000.

Maintenance: Refactoring

7. Big refactorings (4)
- Tease apart inheritance
- Convert procedural design to objects
- Separate domain from presentation
- Extract hierarchy

Total: 72

Martin Fowler.
Refactoring: Improving the Design of Existing Code.
Addison-Wesley. New York. 2000.

Maintenance: Refactoring Example

- ***Replace Type Code with Subclasses***
  - You have an immutable type code that affects the behavior of a class
  - Replace the type code with subclasses

Martin Fowler.
Refactoring: Improving the Design of Existing Code.
Addison-Wesley. New York. 2000.

Maintenance: Refactoring Example

- ***Replace Type Code with Subclasses***

Before

```
public class Shape
{
   private static final int RECTANGLE = 0;
   private static final int SQUARE = 1;
   private int shapeType;
   …
   public void move()
   {
      switch (shapeType)
      {  case RECTANGLE:
            …
            break;
         case SQUARE:
            …
            break;
       }
   }
}
```

Martin Fowler.
Refactoring: Improving the Design of Existing Code.
Addison-Wesley. New York. 2000.

Maintenance: Refactoring Example

- ***Replace Type Code with Subclasses***

After

```
public abstract class Shape
{
   public abstract void move();
}
public class Rectangle extends Shape
{
   public void move { … }
}
public class Square extends Rectangle
{
   public void move { … }
}
```

Martin Fowler.
Refactoring: Improving the Design of Existing Code.
Addison-Wesley. New York. 2000.

Maintenance: Refactoring

Smell	Common Refactorings
Alternative classes with diff interfaces	Rename method, move method
Comments	Extract method, introduce assertion
Data class	Move method, encapsulate field, encapsulate collection
Data clumps	Extract class, introduce parameter object, preserve whole object
Divergent change	Extract class
Duplicated code	Extract method, extract class, pull-up method, form template method
Feature envy	Move method, move field, extract method
Inappropriate intimacy	Move method, move field, change bidirectional association to unidirectional, replace inheritance with delegation, hide delegate

Martin Fowler.
Refactoring: Improving the Design of Existing Code.
Addison-Wesley. New York. 2000.

Maintenance: Refactoring

Smell	Common Refactorings
Incomplete library class	Introduce foreign method, introduce local extension
Large class	Extract class, extract subclass, extract interface, replace data value with object
Lazy class	Inline class, collapse hierarchy
Long method	Extract method, replace temp with query, replace method with method object, decompose conditional
Long parameter list	Replace parameter with method, introduce parameter object, preserve whole object
Message chains	Hide delegate
Middle man	Remove middle man, inline method, replace delegation with inheritance
Parallel inheritance hierarchies	Move method, move field

Martin Fowler.
Refactoring: Improving the Design of Existing Code.
Addison-Wesley. New York. 2000.

Maintenance: Refactoring

Smell	Common Refactorings
Primitive obsession	Replace data value with object, extract class, introduce parameter object, replace array with object, replace type code with class, replace type code with subclasses, replace type code with state/strategy
Refused bequest	Replace inheritance with delegation
Shotgun surgery	Move method, move field, inline class
Speculative generality	Collapse hierarchy, inline class, remove parameter, rename method
Switch statements	Replace conditional with polymorphism, **replace type code with subclasses**, replace type code with state/strategy, replace parameter with explicit methods, introduce null object
Temporary field	Extract class, introduce null object

Martin Fowler.
Refactoring: Improving the Design of Existing Code.
Addison-Wesley. New York. 2000.

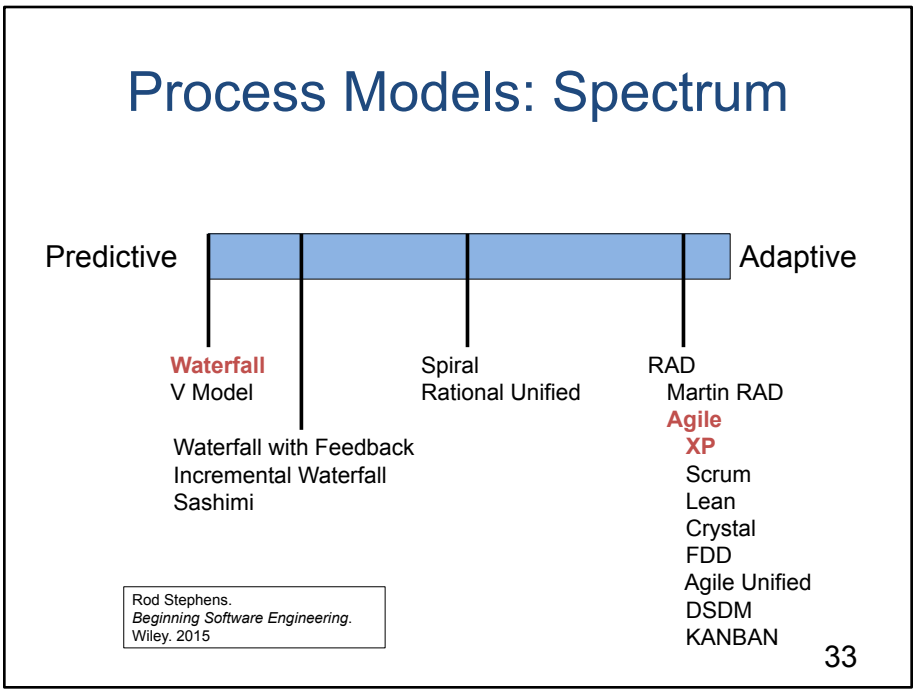
How should you order those stages?

Agenda

- Requirements analysis
- Design
- Implementation
- Debugging
- Testing
- Evaluation
- Maintenance
- **Process models**

Process Models

- ***Process models***
  - How should you order those stages?
  - (And much more)



Process Models: Spectrum

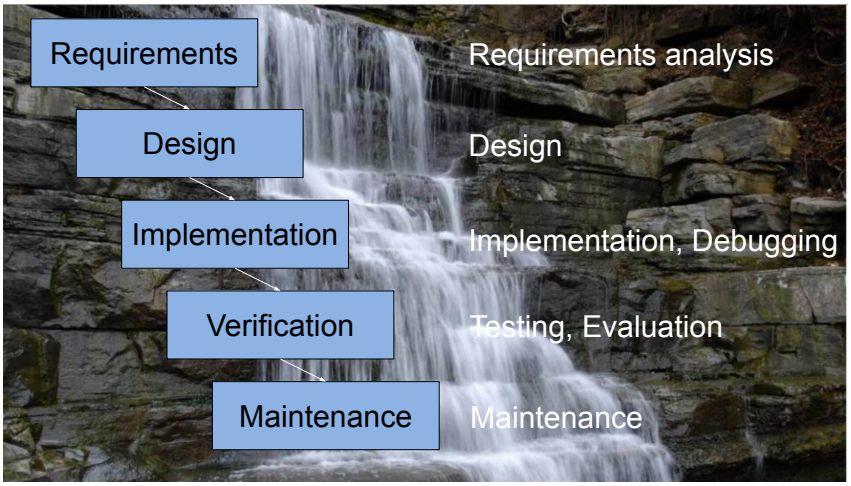
Predictive models

- Assume that we can predict the future
- Assume that we know the current system requirements, and can predict future system requirements

Adaptive models

- Assume that we cannot predict future system requirements
- Instead, assume that we'll need to adapt the system to evolving system requirements which we cannot predict

Process Models: Waterfall



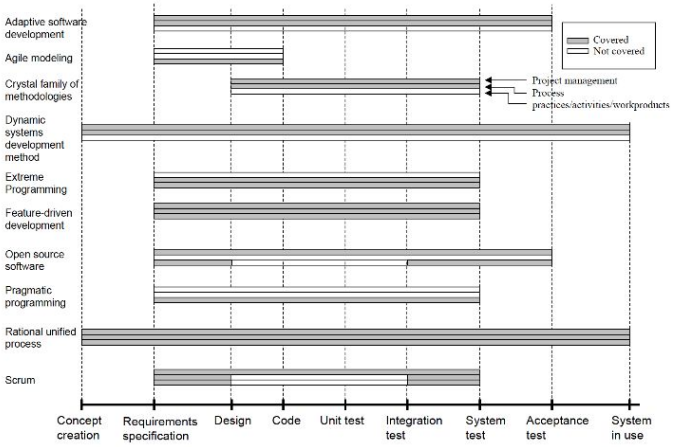
Process Models: Waterfall

- Completely predictive (non-adaptive)
  - From manufacturing industry
- Used by many early software dev projects
  - No other process models were known!
- Required by many funding agencies
  - Agency defines requirements
  - SW company does the rest, while agency monitors progress

Predictive Models: Commentary

- Perfect if all predictions are correct
- It's **hardly ever** the case that all predictions are correct!

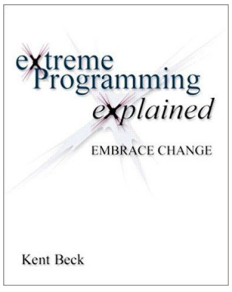
Process Models: Agile



Abrahamson P, Salo O, Ronkainen J, Warsta J (2002). *Agile Software Development Methods: Review and Analysis*. (Technical report). VTT. 478.

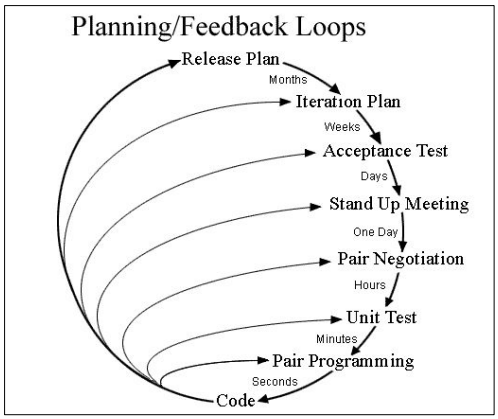
Process Models: Extreme

Kent Beck



2000

Process Models: Extreme



Requirements analysis

Evaluation

Design

Testing

Impl., Debugging

Maintenance

Diagram from Wikipedla *Extreme Programming* page

Process Models: Extreme

- As adaptive (non-predictive) as possible
  - “Extremely” adaptive
  - “Embrace change”
- Essentially, code is the only artifact produced

Process Models: Extreme

- The planning game
- **Small releases**
- Metaphor
- Simple design
- **Testing**
- **Refactoring**
- **Pair pgmming**
- Collective ownership
- Continuous integration
- 40-hour work week
- **On-site customer**
- Coding standards

Kent Beck.
Extreme Programming Explained: Embrace Change.
Addison-Wesley. New York. 2000.

Process Models: Adaptive Commentary

- Appealing!
- Too extreme?
  - An excuse for programmers to avoid some tasks that they find less fun?

Process Models

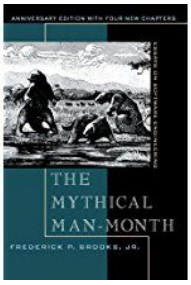
Predictive vs. Adaptive models:

Use Predictive When:	Use Adaptive When:
Developers are plan-oriented, adequately skilled, and have access to external knowledge	**Developers** are agile, highly skilled, collocated, and collaborative
Customers are not collocated	**Customers** are collocated
Requirements are knowable early and largely stable	**Requirements** are largely emergent and change rapidly
Team and **product** are large	**Team** and **product** are small
Primary objective is high assurance	**Primary objective** is rapid value

Boehm, B.
"Get Ready for the Agile Methods, With Care"
Computer 35 (1): 64-69.

Process Models: Commentary

Frederick Brooks



1975
1995

44

Process Models: Commentary

Central tenet of the book:

Adding more software developers to a late project makes it later

Process Models: Commentary

"All software involves **essential** tasks, the fashioning of the complex conceptual structures that compose the abstract software entity, and **accidental** tasks, the representation of those abstract entities in programming languages and the mapping of these onto machine languages within space and speed constraints. Most of the big gains in software productivity have come from removing artificial barriers that have made the **accidental** tasks inordinately hard."

Frederick Brooks.
The Mythical Man Month: Essays on Software Engineering
Addison-Wesley. New York. 1995.

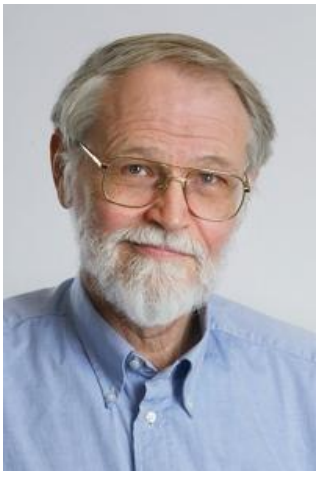
Process Models: Commentary

"How much of what software engineers now do is still devoted to the **accidental**, as opposed to the **essential**? Unless it is more than 9/10 of all effort, shrinking all the **accidental** activities to zero time will not give an order of magnitude improvement."

"There is **no single development**, in either technology or management technique, which by itself **promises even one order of magnitude improvement** in productivity, in reliability, in simplicity."

Frederick Brooks.
The Mythical Man Month: Essays on Software Engineering
Addison-Wesley. New York. 1995.

Process Models: Commentary



Brian
Kernighan

Process Models: Commentary

Epi-Aspects: Aspect-Oriented Conscientious Software

Conscientious software is a recently proposed paradigm for developing reliable, self-sustaining software systems. Conscientious software systems consist of an allopoietic part, which encapsulates application functionality, and an autopoietic part that is responsible for keeping the system alive by monitoring the application and adapting it to environmental changes. Whilst the application can be implemented in a general purpose programming language, the autopoietic part requires a special autopoietic programming language, which does not contain any elements that allow programmers to introduce critical bugs that might crash or stall the conscientious software system. Practical application of the conscientious software paradigm requires solutions to two open problems: The design of suitable lithe programming languages and the proposal of concrete architectures for combining the autopoietic and allopoietic parts. In this paper, we propose a concrete, aspect-oriented architecture for realizing conscientious software. In particular, we introduce epi-aspects, a construct for upgrading new and existing applications into conscientious software. Apart from presenting the architectural design of epi-aspects, we provide an autopoietic simulator and a concrete framework for developing epi-aspects in Java. This framework and the simulator are used to conduct a case study in which we develop and test a conscientious Java application.

Sebastian Fleissner and Elisa Baniassad.
"Epi-Aspects : Aspect-Oriented Conscientious Software."
OOPSLA'07 International Conference on Object-Oriented Programming, Systems, Languages, & Applications No22, Montréal , Canada, 2007.

Process Models: Commentary

Software Methodology and Snake Oil
– Each methodology has the germ of a useful idea
– Each claims to solve major programming problems
– Some are promoted with religious fervor
– In fact most don't seem to work well
– Or don't seem to apply to all programs
– Or can't be taught to others
– A few are genuinely useful and should be part of everyone's repertoire

Brian Kernighan
COS 333 Lecture Slides

Process Models: Commentary

- In summary...
- (Kernighan) Some process models offer good ideas, but...
- (Brooks) Software development is inherently hard, and...
- (Kernighan) Many process models are over-hyped, so...
- (Kernighan) View process models with healthy skepticism

Process Models: Commentary

- Every project is unique
  - Choose a process model that fits the project
  - Be willing to customize that process model

Process Models: Commentary

- Core points:
  - **Requirements**: First determine **who** the users are and **what** your system should do for them
    - **Involve the users!!!**
  - **Design**: Then determine **how** you want your system to work
  - **Implement**, **test**: Then code and test your system
  - **Evaluate**: Then evaluate your system
    - **Involve the users!!!**
  - Iterate as often as you reasonably can

Summary

- We have covered these software engineering topics:
  - (1) Requirements analysis
  - (2) Design
  - (3) Implementation
  - (4) Debugging
  - (5) Testing
  - (6) Evaluation
  - (7) Maintenance
  - (8) Process models

Course Summary

- We have covered:
  - Three-tier programming
    - The Python language, database programming, GUI programming, network programming, server-side web programming, the JavaScript language, client-side web programming, concurrent programming with multiple processes & threads, security issues in web programming, XML and JSON programming, mobile programming

The Python language
Database programming (SQL)
GUI programming (PyQt5)
Network programming (sockets)
Server-side web programming (CGI, Python WSGI, Python Flask/Jinja2, Java Servlets, Java Spark/Velocity, PHP)
Concurrent programming with multiple processes
Concurrent programming with multiple threads (race conditions, deadlocks, inter-thread comm)
The JavaScript language
Client-side web programming (JavaScript, AJAX, jQuery, React, CSS, Bootstrap)
Security issues in web programming (injection, sensitive data exposure, cross-site scripting, authentication, CAS)
XML (DOM and SAX) and JSON programming
Mobile programming (Android)

Course Summary

- We have covered (cont.):
  - Software engineering
    - All through the course, but with focus at the end…
    - Requirements analysis, design, implementation, debugging, testing, evaluation, maintenance, process models

Requirements analysis (UML)
Design (design heuristics, design patterns, MVC, separation of concerns)
Implementation (buy vs. use open-source vs. build decision)
Debugging
Testing (internal testing, external testing, external testing, code coverage tools, test automation tools)
Evaluation (user evaluation, interviews, evaluation by experts, heuristic evaluation, cognitive walkthrough)
Maintenance (profiling tools, refactoring)
Process models (predictive and adaptive)

The Rest of the Course

- **Apr 26, 27, 28, 29**
  - Project presentation with final demo
- **May 3 (Dean's Date) at 5PM**
  - Final Google drive
    - *Project Overview* document (from early in course), *Timeline* document (from throughout the course), presentation slides, *User's Guide* document, *Programmer's Guide* document, *Product Evaluation* document, *Project Evaluation* document, source code (compressed file)
  - Final product!

The Rest of the Course

- **Approx May 17**
  - Project grade reports to you
  - Letter grades to Registrar

Thank you!

Thank you
It has been my great pleasure to work with you
I hope your project concludes well
    I hope it transcends COS 333!
I'm looking forward to seeing you at your project presentation
I hope you enjoy the summer
I hope that our paths cross again
I wish you all the best
