

Assignment 2: Advanced Features

COS 426: Computer Graphics (Spring 2022)

Vedant Dhopte, Ethan Tseng

Agenda

- General tips on tackling A2
- Going over more advanced features of A2
 - Scale-Dependent Smoothing
 - Truncate, Extrude, Bevel
 - Triangle/Quad Topology
 - Loop/Catmull-Clark Subdivision
 - Curvature

Logistics

- Midterm is Thursday, 03/03
 - Practice exam will be released next week
 - Next week's precept will be a review session
 - [Exercises page](#)

One Primitive A Time

- Start local
 - Modifications to a primitive shouldn't affect other primitives
- Work with one primitive first

Decouple Topology and Geometry

- Topology
 - Relations between structures defining the mesh
 - eg. What vertices do I need to add?
 - eg. Between what vertices should I add an edge?
- Geometry
 - Spatial relationships, shape, form
 - eg. Where on the edge should I insert the vertex?
- Figure out topology first, then geometry

Other Tips

- Caution with data
 - Do I need to store information about data before modifying them?
- Keep track of new vs old primitives (faces, vertices, half edges)
 - New primitives are always added at the end of their respective arrays

Other Tips

- Count primitives after modifications
 - `console.log` is your friend!
- Draw your operations out
- Check your helper functions and mesh traversal functions
- Applying operations to *selected* primitives

Scale-Dependent Smoothing

- Scale delta to $\delta \cdot \frac{A}{A_v}$ where

$$A_v = \sum_{f_i \in \text{ring}} \text{area}(f_i)$$

$$A = \frac{1}{N_v} \cdot \sum_{v_i \in V} A_{v_i}$$

$$A = \frac{3}{N_v} \cdot \sum_{f_i \in F} \text{area}(f_i)$$

Truncate

- Cut the corners off of a shape
- For every vertex with N edges...
 - Add $N-1$ vertices
 - Add 1 face
 - How many edges?

Truncate - Topology

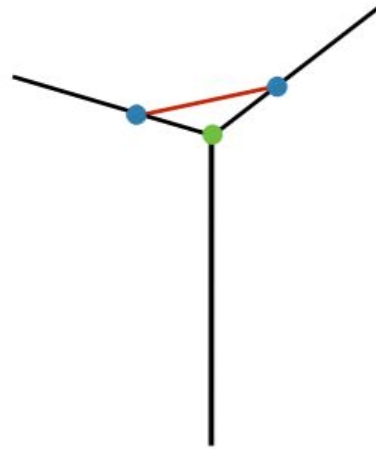

- Consider a vertex with 3 edges
- So we need to add 2 vertices, 1 face

Initial

SplitEdgeMakeVert x 2

SplitFaceMakeEdge

Note that the blue vertices should be on top of original vertex in reality.

They are moved apart for easier visualization.

Truncate - Geometry

- Now we move vertices along the edges
 - Calculate all offset vectors before applying changes

After Making Face

Apply Offsets

Extrude

- Each face is moved along its normal
- For each N-gon face:
 - Add N vertices
 - Add N faces

Extrude - Topology

- Note again that the visualizations don't represent accurate spatial relations
- New blue vertices should be directly on top of the old ones at first!!!

Extrude - Topology

- Let's think about the end result for 1 face

3D View:

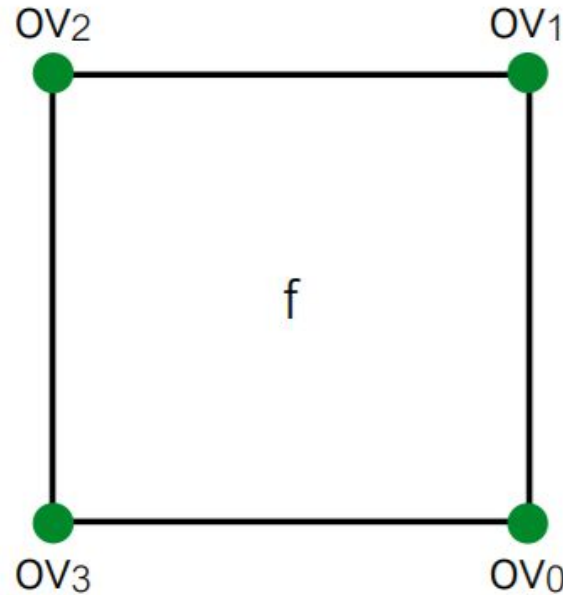

Topological View:

Extrude - Topology

- Denote **ov** for **old vert** and **nv** for **new vert**

Extrude - Topology

- First, insert 4 new vertices
 - SplitEdgeMakeVert x 4
 - Again, there's no actual movement happening

Extrude - Topology

- Then, split 4 **adjacent** faces
 - SplitFaceMakeEdge x 4
 - Between which 2 vertices should we split the face each time?
 - Which vertex would we like on which face at the end?

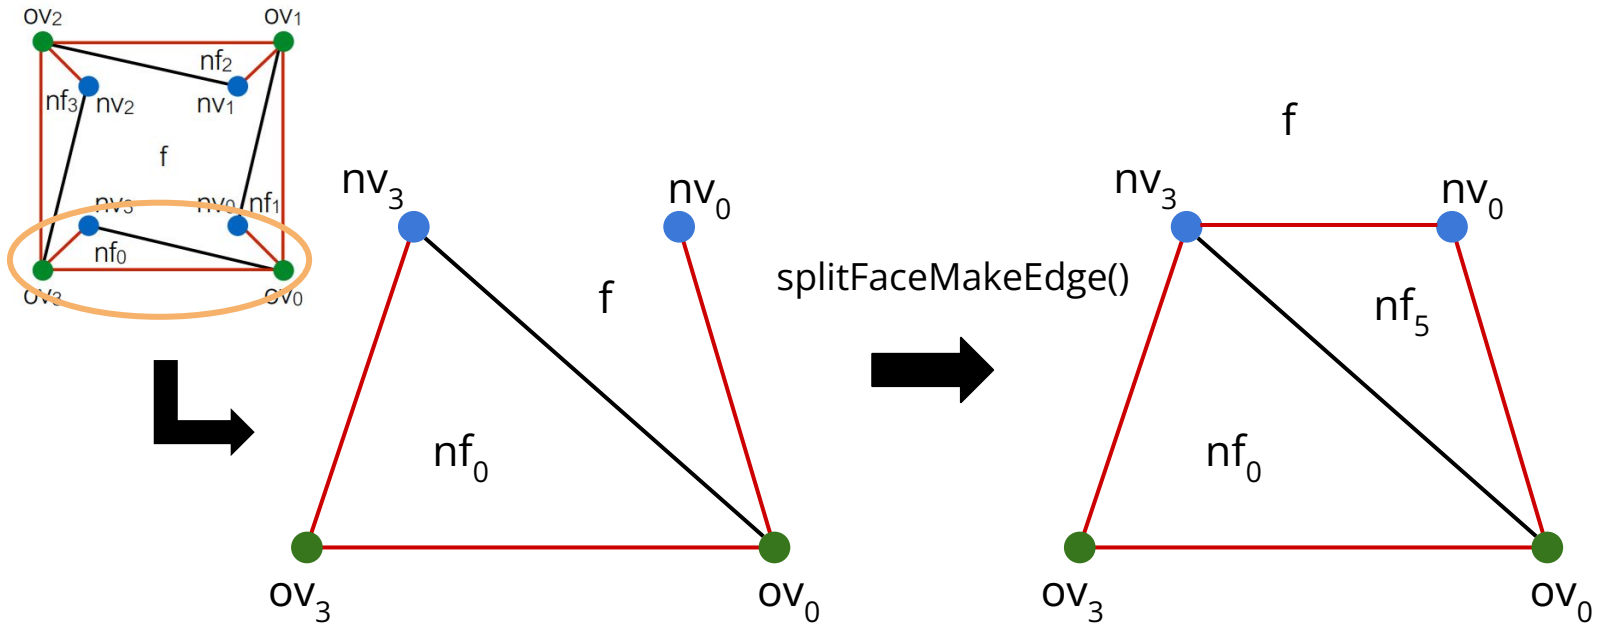

Extrude - Topology

- Then, split 4 **adjacent** faces
 - SplitFaceMakeEdge x 4
 - Between which 2 vertices should we split the face each time?
 - Which vertex would we like on which face at the end?

Extrude - Topology

- We want to connect the new vertices

Extrude - Topology

- Now join the two new faces

Extrude - Geometry

- Simple
 - Move each new vert by `factor * f.normal`

Bevel

- We want to “flatten” corners and edges
 - Each edge “becomes” a face
 - Each vertex “becomes” a face

Bevel - Topology

- A good place to start is Vertex => Face, aka truncate
- Now we want to convert edges to faces
 - Let's consider one edge

Bevel - Topology

- For each corner face, split all of its edges in half

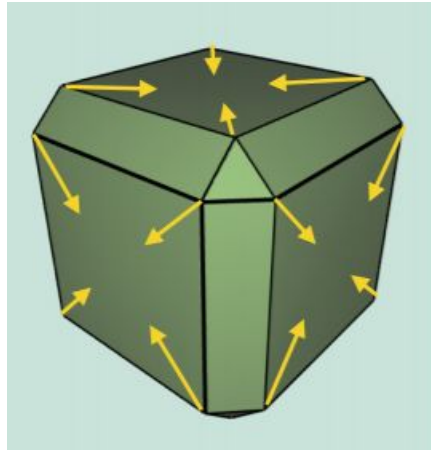

Bevel - Topology

- For each long edge $(v1, v2)$...
 - Connect the neighboring verts of $v1$ and $v2$
 - Remove the original long edge
 - Remove $v1$ and $v2$

Bevel - Geometry

- Simply move each vertex closer to the centroid of its corresponding face based on the factor parameter

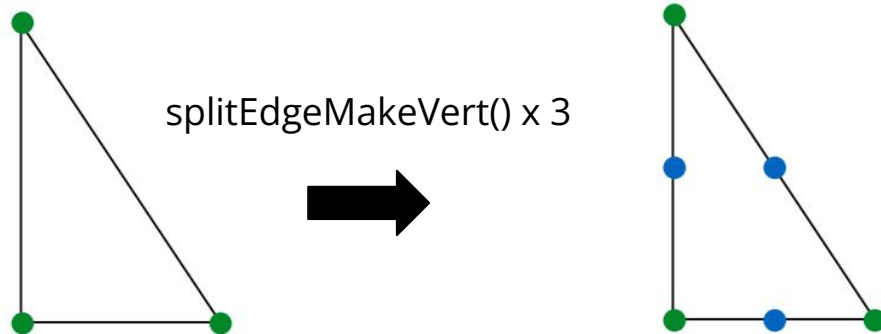

Triangle Topology

- Splits each selected face in the mesh into four triangles
- First, split all n-gons into triangles
 - `Filters.triangulate()`

TriTop - Topology

- Split all edges
 - For each face, add 3 vertices and 3 faces
 - Create a list of all half edges beforehand
 - When you split a half edge, opposite will be split, so you need to keep track - avoid double splitting

TriTop - Topology

- Join new vertices around a face
 - Keep track of new indices by index - new ones are always added to end of verts array
- Do edge splits and join verts in separate loops

TriTop - Loop Subdivision

- Calculate new positions of vertices as you perform triangle topology
 - Find positions of old verts before adding new verts, and positions of new verts before joining them
- One TriTop is done, update positions

Odd

Even

$$\beta = \begin{cases} \frac{3}{8n} & n > 3 \\ \frac{3}{16} & n = 3 \end{cases}$$

These weights are w/
respect to the old
vertices!

TriTop - Loop Subdivision

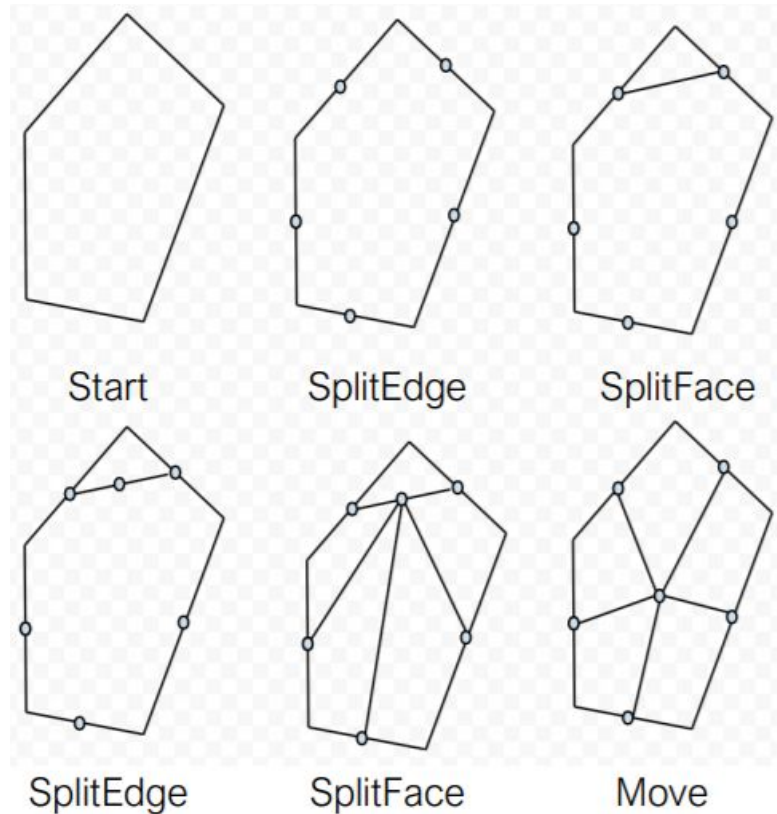

- On boundary edges, use a different mask:

- To prevent degenerate faces, non-selected faces that touch the boundary should receive a TriTop subdivision.

Quad Subdivision

- Split each edge
- Join any 2 new vertices
- Split this new edge, denote this vert nv_0
- Join the rest of the new vertices with nv_0
- Move nv_0 to centroid

Catmull-Clark Subdivision

Centroids

MidPoints

Old Vertices

n = number of neighbors of vert

Catmull-Clark Subdivision

n = number of neighbors of vert

Catmull-Clark Subdivision

- Boundaries: Same boundary weights as loop, but more complicated when dealing with boundary faces.
 - Details are included in the assignment description

Curvature

- We want to calculate the curvature associated with a vertex
- Then color it based on its curvature

Curvature

- This paper: [Akleman, 2006](#)
- Section 2.2 is the most relevant part
 - Gaussian curvature = angular deflection / area associated with vertex
 - Area associated with vertex = Sum of area of faces neighboring vertex
- (This makes for really good art submissions!)

Q&A
