1.3 STACKS AND QUEUES

- ▶ *stacks*
- ▶ *resizing arrays*
- ▶ *queues*
- ▶ *generics*
- ▶ *iterators* ← see next lecture and precept

Stacks and queues

Fundamental data types.

- Value: **collection** of objects.
- Operations: **add**, **remove**, **iterate**, size, test if empty.
- Intent is clear when we add.
- Which item do we remove?

Stack. Remove the item most recently added. ← LIFO = “last in first out”

Queue. Remove the item least recently added. ← FIFO = “first in first out”

Programming assignment 2

Deque. Remove either the **most recently** or the **least recently** added item.

Randomized queue. Remove a **random** item.

Your job.

- Identify a data structure that meets the performance requirements.
- Implement it from scratch.

Data type design: API, client, and implementation

Separate client and implementation via API.

API: operations that characterize the behavior of a data type.

Client: program that uses the API operations.

Implementation: code that implements the API operations.

Benefits.

- **Design:** create modular, reusable libraries.
- **Performance:** substitute faster implementations.

Ex. Stack, queue, priority queue, symbol table, set, union-find,

<https://algs4.cs.princeton.edu>

1.3 STACKS AND QUEUES

- *stacks*
- *resizing arrays*
- *queues*
- *generics*
- *iterators*

Stack API

Warmup API. Stack of strings data type.

```
public class StackOfStrings
```

```
    StackOfStrings()           create an empty stack
```

```
    void push(String item)     add a new string to stack
```

```
    String pop()               remove and return the string  
                               most recently added
```

```
    boolean isEmpty()          is the stack empty?
```

```
    int size()                 number of strings on the stack
```

Performance goals. Every operation takes $\Theta(1)$ time; stack with n items uses $\Theta(n)$ memory.

Warmup client. Reverse a stream of strings from standard input.

```
public static double square(double a) {  
    return a*a;  
}
```

variable	a
value	3.0

square(3.0)

hypotenuse(3.0, 4.0)

main()

function-call stack

How to implement efficiently a stack with a singly linked list?

C. *Both A and B.*

D. *Neither A nor B.*

Stack: linked-list implementation

- Maintain pointer `first` to first node in a singly linked list.
- Push new item before `first`.
- Pop item from `first`.

Stack pop: linked-list implementation

singly linked list

save item to return

```
String item = first.item;
```

delete first node

```
first = first.next;
```

garbage collector reclaims memory
when no remaining references

return saved item

```
return item;
```

nested class

```
private class Node
{
    private String item;
    private Node next;
}
```

Stack push: linked-list implementation

save a link to the list

```
Node oldFirst = first;
```

create a new node at the front

```
first = new Node();
```

initialize the instance variables in the new Node

```
first.item = "dream";  
first.next = oldFirst;
```

nested class

```
private class Node  
{  
    private String item;  
    private Node next;  
}
```

Stack: linked-list implementation

```
public class LinkedStackOfStrings
{
    private Node first = null;

    private class Node
    {
        private String item;
        private Node next;
    }

    public boolean isEmpty()
    { return first == null; }

    public void push(String item)
    {
        Node oldFirst = first;
        first = new Node();
        first.item = item;
        first.next = oldFirst;
    }

    public String pop()
    {
        String item = first.item;
        first = first.next;
        return item;
    }
}
```

← private nested class
(access modifiers for instance variables of such a class don't matter)

← no Node constructor explicitly defined ⇒
Java supplies default no-argument constructor

Stack: linked-list implementation performance

Proposition. Every operation takes $\Theta(1)$ time.

Proposition. A `LinkedStackOfStrings` with n items has n `Node` objects and uses $\sim 40 n$ bytes.

nested class

```
private class Node
{
    String item;
    Node next;
}
```

16 bytes (object overhead)

8 bytes (non-static nested class extra overhead)

8 bytes (reference to `String`)

8 bytes (reference to `Node`)

40 bytes per stack `Node`

Remark. This counts the memory for the stack itself (including the string references).
(but not the memory for the string objects, which the client allocates)

How to implement efficiently a fixed-capacity stack with an array?

A.

least recently added

I	have	a	dream	today	!	<i>null</i>	<i>null</i>	<i>null</i>	<i>null</i>
0	1	2	3	4	5	6	7	8	9

B.

most recently added

!	today	dream	a	have	I	<i>null</i>	<i>null</i>	<i>null</i>	<i>null</i>
0	1	2	3	4	5	6	7	8	9

C. *Both A and B.*

D. *Neither A nor B.*

Fixed-capacity stack: array implementation

- Use array `s[]` to store n items on stack.
- Push: add new item at `s[n]`.
- Pop: remove item from `s[n-1]`.

Defect. Stack overflows when n exceeds `capacity`. [stay tuned]

Fixed-capacity stack: array implementation

```
public class FixedCapacityStackOfStrings
{
```

```
    private String[] s;
    private int n = 0;
```

a cheat
(stay tuned)

```
    public FixedCapacityStackOfStrings(int capacity)
    { s = new String[capacity]; }
```

```
    public boolean isEmpty()
    { return n == 0; }
```

```
    public void push(String item)
    { s[n++] = item; }
```

post-increment operator:
use as index into array;
then increment n

```
    public String pop()
    { return s[--n]; }
```

pre-decrement operator:
decrement n;
then use as index into array

```
}
```

Stack considerations

Underflow. Throw exception if `pop()` called when stack is empty.

Overflow. Use “resizing array” for array implementation. [next section]

Null items. We allow `null` items to be added.

Loitering. Holding an object reference when it is no longer needed.

```
public String pop()
{ return s[--n]; }
```

loitering

```
public String pop()
{
    String item = s[n-1];
    s[n-1] = null;
    n--;
    return item;
}
```

no loitering

<https://algs4.cs.princeton.edu>

1.3 STACKS AND QUEUES

- *stacks*
- *resizing arrays*
- *queues*
- *generics*
- *iterators*

Stack: resizing-array implementation

Problem. Requiring client to provide capacity does not implement API!

Q. How to grow and shrink array?

Naive approach.

- Push: increase length of array `s[]` by 1.
- Pop: decrease length of array `s[]` by 1.

Too expensive.

- Need to copy all items to a new array, for each push/pop.
 - Array accesses to add item k : $1 + 2(k - 1)$ 
 - Array accesses to add first n items: $n + (2 + 4 + 6 + \dots + 2(n - 1)) \sim n^2$.

infeasible for large n
- to copy $k-1$ elements from old array to new array
(ignoring cost to create new array)

Challenge. Ensure that array resizing happens infrequently.

Stack: resizing-array implementation

Q. How to grow array?

A. If array is full, create a new array of **twice** the length, and copy items.

“repeated doubling”

```
public class FixedCapacityStackOfStrings
{
    private String[] s;
    private int n = 0;

    public ResizingArrayStackOfStrings()
    { s = new String[1]; }

    public void push(String item)
    {
        if (n == s.length) resize(2 * s.length);
        s[n++] = item;
    }

    private void resize(int capacity)
    {
        String[] copy = new String[capacity];
        for (int i = 0; i < n; i++)
            copy[i] = s[i];
        s = copy;
    }
}
```

Stack: resizing-array implementation

Q. How to grow array?

A. If array is full, create a new array of **twice** the length, and copy items.

“repeated doubling”

Cost is reasonable.

- Need to copy all items to a new array, but, now, only infrequently.

- Array accesses to add item k

- [k a power of 2] $1 + k$ ← to copy $k/2$ elements from old array to new array (ignoring cost to create new array)
 - [k not a power of 2] 1 ← no array resizing

- Array accesses to add first $n = 2^i$ items: $n + (2 + 4 + 8 + 16 + \dots + n) \sim 3n$.

↑
geometric sum

↑
feasible for large n

Stack: resizing-array implementation

Q. How to shrink array?

First try.

- Push: double length of array `s[]` when array is full.
- Pop: halve length of array `s[]` when array is **one-half full**.

Too expensive for some sequences of operations.

- Consider alternating sequence of push and pop operations when array is full.
- Each operation takes $\Theta(n)$ time.

full	I	have	a	dream				
push("today")	I	have	a	dream	today	null	null	null
pop()	I	have	a	dream				
push("today")	I	have	a	dream	today	null	null	null

Stack: resizing-array implementation

Q. How to shrink array?

Efficient solution.

- Push: double length of array `s[]` when array is full.
- Pop: halve length of array `s[]` when array is **one-quarter full**.

```
public String pop()
{
    String item = s[--n];
    s[n] = null;
    if (n > 0 && n == s.length/4) resize(s.length/2);
    return item;
}
```

so, on average, each
operation takes $\Theta(1)$ time

Proposition. Starting from an empty stack, any sequence of m push/pop operations takes $\Theta(m)$ time.

Amortized analysis

Worst-case analysis. Worst-case running time for an **individual operation**.

Amortized analysis. Worst-case running time for a **sequence of operations**.

- Amortized cost per operation = total cost / # operations.
- Provides more realistic analysis when some operations are expensive but rare.

Bob Tarjan
(1986 Turing award)

	worst	amortized
construct	1	1
push	n	1
pop	n	1
size	1	1

order of growth of running time for
resizing-array stack with n items

Stack resizing-array: memory usage

Proposition. A ResizingArrayStackOfStrings with n items use between $\sim 8n$ and $\sim 32n$ bytes of memory.

- Always between 25% and 100% full.
- $\sim 8n$ when full. [array length = n]
- $\sim 32n$ when one-quarter full. [array length = $4n$]

```
public class ResizingArrayStackOfStrings
{
    private String[] s; ← 8 bytes × array length
    private int n = 0;

    :
}
```

Remark. This counts the memory for the stack itself (including the string references).
(but not the memory for the string objects, which the client allocates)

Stack implementations: resizing array vs. linked list

Tradeoffs. Can implement a stack with either resizing array or linked list. Which is better?

Linked-list implementation.

- Stronger performance guarantee.
- More memory.

Resizing-array implementation.

- Weaker performance guarantee.
- Less memory.
- Better use of cache.

↑
accessing adjacent memory locations (e.g., in an array)
is much faster than accessing
nonadjacent memory locations (e.g., in a linked list)

<https://algs4.cs.princeton.edu>

1.3 STACKS AND QUEUES

- *stacks*
- *resizing arrays*
- *queues*
- *generics*
- *iterators*

Queue of strings API

```
public class QueueOfStrings
```

```
    QueueOfStrings()           create an empty queue
```

```
    void enqueue(String item)  add a new string to queue
```

```
    String dequeue()           remove and return the string  
                                least recently added
```

```
    boolean isEmpty()          is the queue empty?
```

```
    int size()                 number of strings on the queue
```

Performance goals. Every operation takes $\Theta(1)$ time; queue with n items uses $\Theta(n)$ memory.

How to implement efficiently a queue with a singly linked list?

C. *Both A and B.*

D. *Neither A nor B.*

Queue: linked-list implementation

- Maintain one pointer *first* to first node in a singly linked list.
- Maintain another pointer *last* to last node.
- Dequeue from *first*.
- Enqueue after *last*.

Queue dequeue: linked-list implementation

Remark. Code is identical to `pop()`.

singly linked list

save item to return

```
String item = first.item;
```

delete first node

```
first = first.next;
```

return saved item

```
return item;
```

nested class

```
private class Node
{
    private String item;
    private Node next;
}
```

Queue enqueue: linked-list implementation

save a link to the list

```
Node oldLast = last;
```

create a new node at the end

```
last = new Node();  
last.item = "dream";
```

link together

```
oldLast.next = last;
```

nested class

```
private class Node  
{  
    private String item;  
    private Node next;  
}
```

Queue: linked-list implementation

```
public class LinkedQueueOfStrings
{
    private Node first, last;

    private class Node
    { /* same as in LinkedStackOfStrings */ }

    public boolean isEmpty()
    { return first == null; }
```

```
    public void enqueue(String item)
    {
        Node oldLast = last;
        last = new Node();
        last.item = item;
        last.next = null;
        if (isEmpty()) first = last;
        else          oldLast.next = last;
    }
```

```
    public String dequeue()
    {
        String item = first.item;
        first       = first.next;
        if (isEmpty()) last = null;
        return item;
    }
```

```
}
```

← corner case: add to an empty queue

← corner case: remove down to an empty queue

QUEUE: RESIZING-ARRAY IMPLEMENTATION

Goal. Implement a **queue** using a **resizing array** so that, starting from an empty queue, any sequence of m operations takes $\Theta(m)$ time.

least recently added

most recently added

QUEUE: RESIZING-ARRAY IMPLEMENTATION

Goal. Implement a **queue** using a **resizing array** so that, starting from an empty queue, any sequence of m operations takes $\Theta(m)$ time.

QUEUE WITH TWO STACKS

Problem. Implement a queue with two stacks so that:

- Each queue operation makes $\Theta(1)$ stack operations.
- $\Theta(1)$ extra memory (besides two stacks).

Applications.

- Job interview.
- Implement an immutable or persistent queue.
- Implement a queue in a (purely) functional programming language.

Haskell

Lisp

OCaml

<https://algs4.cs.princeton.edu>

1.3 STACKS AND QUEUES

- *stacks*
- *resizing arrays*
- *queues*
- ***generics***
- *iterators*

Parameterized stack

We implemented: StackOfStrings.

We also want: StackOfURLs, StackOfInts, StackOfApples, StackOfOranges,

Solution in Java: generics.

type parameter
(use syntax both to specify type and to call constructor)

```
Stack<Apple> stack = new Stack<Apple>();  
Apple apple = new Apple();  
Orange orange = new Orange();  
stack.push(apple);  
stack.push(orange);  
...
```

← compile-time error

Generic stack: linked-list implementation

```
public class LinkedStackOfStrings
{
    private Node first = null;

    private class Node
    {
        String item;
        Node next;
    }

    public boolean isEmpty()
    { return first == null; }

    public void push(String item)
    {
        Node oldfirst = first;
        first = new Node();
        first.item = item;
        first.next = oldfirst;
    }

    public String pop()
    {
        String item = first.item;
        first = first.next;
        return item;
    }
}
```

stack of strings (linked list)

```
public class Stack<Item>
{
    private Node first = null;

    private class Node
    {
        Item item;
        Node next;
    }

    public boolean isEmpty()
    { return first == null; }

    public void push(Item item)
    {
        Node oldfirst = first;
        first = new Node();
        first.item = item;
        first.next = oldfirst;
    }

    public Item pop()
    {
        Item item = first.item;
        first = first.next;
        return item;
    }
}
```

generic type name

generic stack (linked list)

Generic stack: array implementation

The way it should be.

```
public class FixedCapacityStackOfStrings
{
    private String[] s;
    private int n = 0;

    public ...StackOfStrings(int capacity)
    { s = new String[capacity]; }

    public boolean isEmpty()
    { return n == 0; }

    public void push(String item)
    { s[n++] = item; }

    public String pop()
    { return s[--n]; }
}
```

stack of strings (fixed-length array)

```
public class FixedCapacityStack<Item>
{
    private Item[] s;
    private int n = 0;

    public FixedCapacityStack(int capacity)
    { s = new Item[capacity]; }

    public boolean isEmpty()
    { return n == 0; }

    public void push(Item item)
    { s[n++] = item; }

    public Item pop()
    { return s[--n]; }
}
```

generic stack (fixed-length array) ?

← @#\$*! generic array creation
not allowed in Java

Generic stack: array implementation

The way it should be.

```
public class FixedCapacityStackOfStrings
{
    private String[] s;
    private int n = 0;

    public ...StackOfStrings(int capacity)
    { s = new String[capacity]; }

    public boolean isEmpty()
    { return n == 0; }

    public void push(String item)
    { s[n++] = item; }

    public String pop()
    { return s[--n]; }
}
```

stack of strings (fixed-length array)

```
public class FixedCapacityStack<Item>
{
    private Item[] s;
    private int n = 0;

    public FixedCapacityStack(int capacity)
    { s = (Item[]) new Object[capacity]; }

    public boolean isEmpty()
    { return n == 0; }

    public void push(Item item)
    { s[n++] = item; }

    public Item pop()
    { return s[--n]; }
}
```

generic stack (fixed-length array)

← the ugly cast

Unchecked cast

```
~/Desktop/queues> javac -Xlint:unchecked FixedCapacityStack.java
FixedCapacityStack.java:26: warning: [unchecked] unchecked cast
    s = (Item[]) new Object[capacity];
           ^
  required: Item[]
  found:    Object[]
  where Item is a type-variable:
    Item extends Object declared in class FixedCapacityStack
1 warning
```

Q. Why does Java require a cast (or reflection)?

Short answer. Backward compatibility.

Long answer. Need to learn about **type erasure** and **covariant arrays**.

How to declare and initialize an empty stack of integers in Java?

- A. `Stack stack = new Stack<int>();`
- B. `Stack<int> stack = new Stack();`
- C. `Stack<int> stack = new Stack<int>();`
- D. *None of the above.*

Generic data types: autoboxing and unboxing

Q. What to do about primitive types?

Wrapper type.

- Each primitive type has an associated “**wrapper**” reference type.
- Ex: `Integer` is wrapper type associated with `int`.

Autoboxing. Automatic cast from primitive type to wrapper type.

Unboxing. Automatic cast from wrapper type to primitive type.

```
Stack<Integer> stack = new Stack<Integer>();  
stack.push(17);           // stack.push(Integer.valueOf(17));  
int a = stack.pop();      // int a = stack.pop().intValue();
```

Bottom line. Client code can use generic stack for **any** type of data.

Caveat. Performance overhead for primitive types.

Java collections framework

Java's library of collection data types.

- `java.util.LinkedList` [doubly linked list]
- `java.util.ArrayList` [resizing array]

OVERVIEWMODULEPACKAGECLASSUSETREEDEPRECATEDINDEXHELP

Module java.base
Package java.util
Class ArrayList<E>

java.lang.Object
 java.util.AbstractCollection<E>
 java.util.AbstractList<E>
 java.util.ArrayList<E>

Type Parameters:
E - the type of elements in this list

All Implemented Interfaces:
Serializable, Cloneable, Iterable<E>, Collection<E>, List<E>, RandomAccess

Direct Known Subclasses:
AttributeList, RoleList, RoleUnresolvedList

public class ArrayList<E>
 extends AbstractList<E>
 implements List<E>, RandomAccess, Cloneable, Serializable

Resizable-array implementation of the List interface. Implements all optional list operations, and permits all elements, including null. In addition to implementing the List interface, this class provides methods to manipulate the size of the array that is used internally to store the list. (This class is roughly equivalent to Vector, except that it is unsynchronized.)

The size, isEmpty, get, set, iterator, and listIterator operations run in constant time. The add operation runs in *amortized constant time*, that is, adding n elements requires O(n) time. All of the other operations run in linear time (roughly speaking). The constant factor is low compared to that for the LinkedList implementation.

OVERVIEWMODULEPACKAGECLASSUSETREEDEPRECATEDINDEXHELP

ALL CLASSES

SUMMARY: NESTED | FIELD | CONSTR | METHODDETAIL: FIELD | CONSTR | METHOD

Module java.base
Package java.util
Class LinkedList<E>

java.lang.Object
 java.util.AbstractCollection<E>
 java.util.AbstractList<E>
 java.util.AbstractSequentialList<E>
 java.util.LinkedList<E>

Type Parameters:
E - the type of elements held in this collection

All Implemented Interfaces:
Serializable, Cloneable, Iterable<E>, Collection<E>, Deque<E>, List<E>, Queue<E>

public class LinkedList<E>
 extends AbstractSequentialList<E>
 implements List<E>, Deque<E>, Cloneable, Serializable

Doubly-linked list implementation of the List and Deque interfaces. Implements all optional list operations, and permits all elements (including null).

All of the operations perform as could be expected for a doubly-linked list. Operations that index into the list will traverse the list from the beginning or the end, whichever is closer to the specified index.

This course. Implement from scratch (once).

Beyond. Basis for understanding performance guarantees.

Best practices.

- Use our `Stack` and `Queue` for stacks and queues to improve design and efficiency.
- Use Java's `ArrayList` or `LinkedList` when other ops needed.
(but remember that some ops are inefficient)

Stacks and queues summary

Fundamental data types.

- Value: **collection** of objects.
- Operations: **add**, **remove**, iterate, size, test if empty.

Stack. [LIFO] Remove the item most recently added.

Queue. [FIFO] Remove the item least recently added.

Efficient implementations.

- Singly linked list.
- Resizing array.

Next time. Advanced Java features (including **iterators** for collections).

*“ Linked lists, nodes connected with care,
Arrays resizing, with memory to spare.
Organizing data, their only need,
Helping us, with efficiency indeed. ”*
