

Programmable Networks

Jennifer Rexford COS 461: Computer Networks

The Internet: A Remarkable Story

- Tremendous success
 - From research experiment to global infrastructure

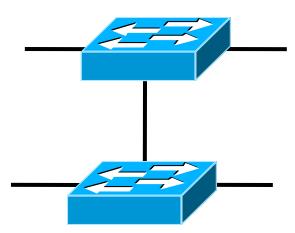

- Brilliance of under-specifying
 - Network: best-effort packet delivery
 - Hosts: arbitrary applications
- Enables innovation in applications
 - Web, P2P, VoIP, social networks, smart cars, ...
- But, change is easy only at the edge... ☺

Inside the 'Net: A Different Story...

- Closed equipment
 - Software bundled with hardware
 - Vendor-specific interfaces
- Over specified
 - Slow protocol standardization
- Few people can innovate
 - Equipment vendors write the code
 - Long delays to introduce new features

Impacts performance, security, reliability, cost...

Networks are Hard to Manage

- Operating a network is expensive
 - More than half the cost of a network
 - Yet, operator error causes most outages
- Buggy software in the equipment
 - Routers with 20+ million lines of code
 - Cascading failures, vulnerabilities, etc.
- The network is "in the way"
 - Especially in data centers and the home

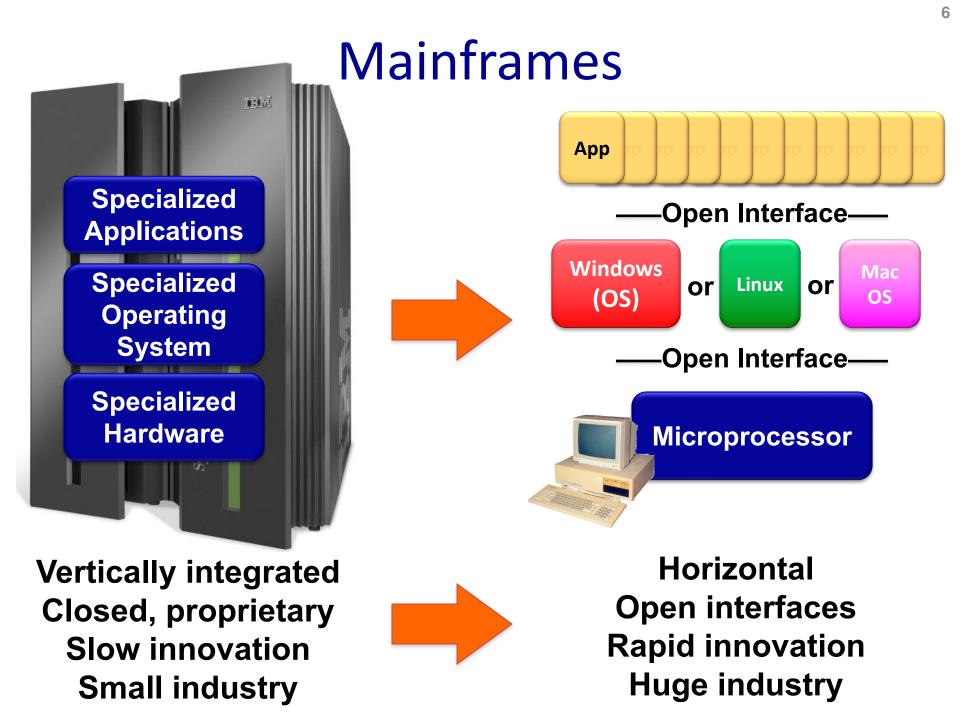

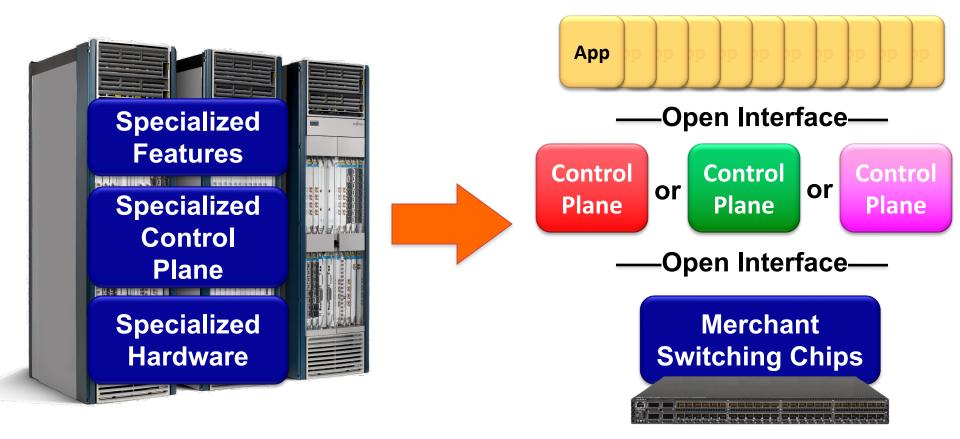

A Helpful Analogy

From Nick McKeown's talk "Making SDN Work" at the Open Networking Summit, April 2012

Routers/Switches

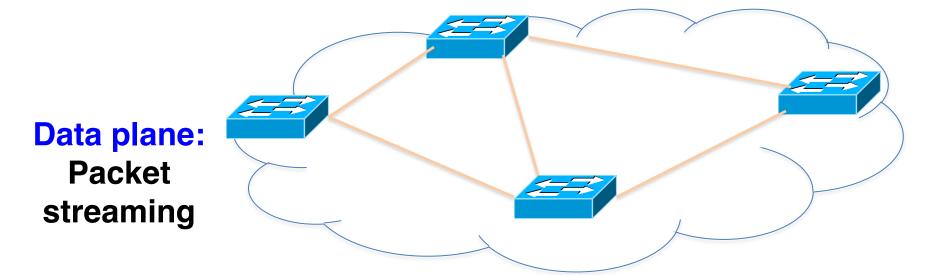

Vertically integrated Closed, proprietary Slow innovation

Horizontal Open interfaces Rapid innovation

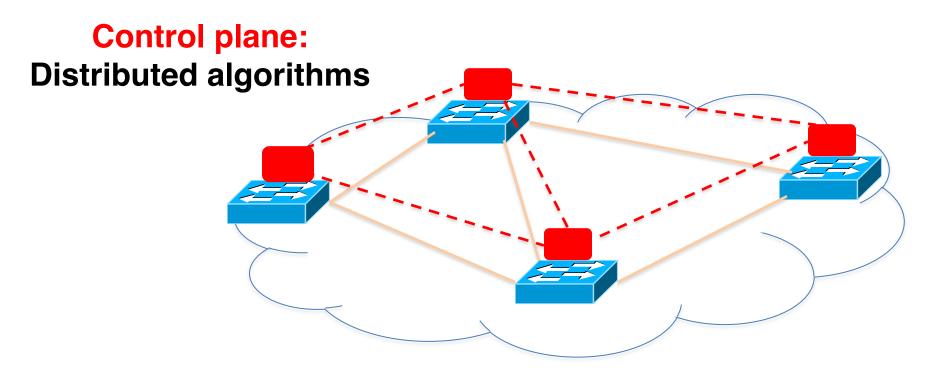

Rethinking the "Division of Labor"

Traditional Computer Networks

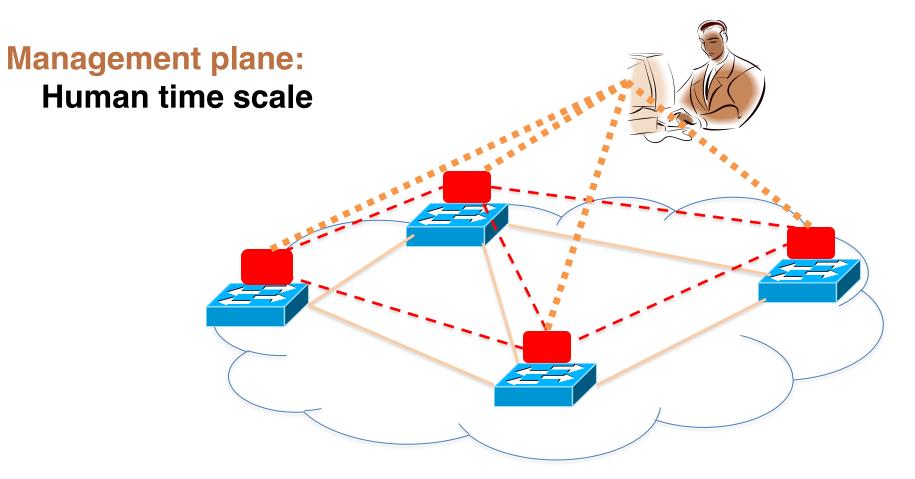

Forward, filter, buffer, mark, rate-limit, and measure packets

Traditional Computer Networks

Track topology changes, compute routes, install forwarding rules

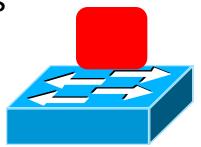

Traditional Computer Networks

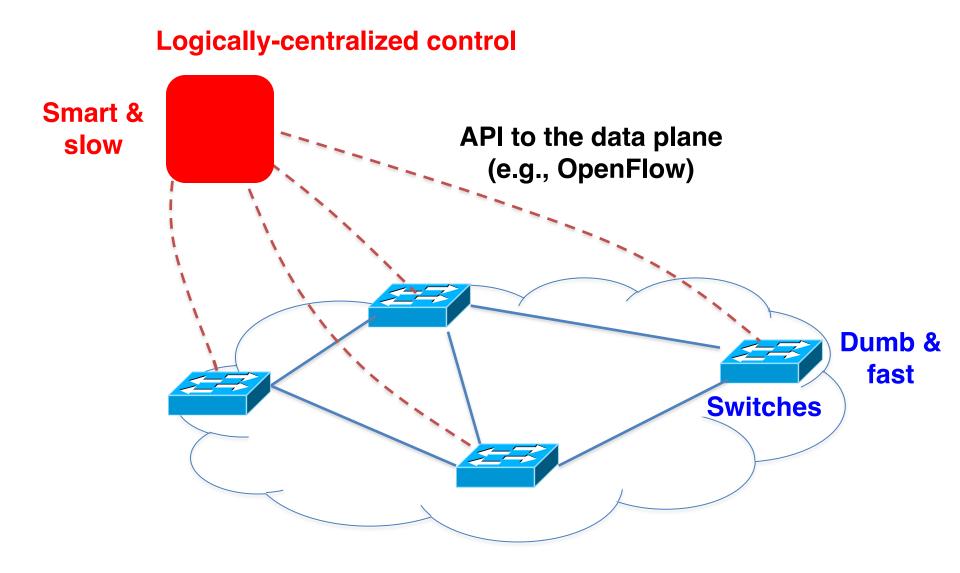

Collect measurements and configure the equipment

Death to the Control Plane!

- Simpler management
 - No need to "invert" control-plane operations
- Faster pace of innovation
 - Less dependence on vendors and standards
- Easier interoperability
 - Compatibility only in "wire" protocols
- Simpler, cheaper equipment
 - Minimal software

Software Defined Networking (SDN)

OpenFlow Networks

http://ccr.sigcomm.org/online/files/p69-v38n2n-mckeown.pdf

Data-Plane: Simple Packet Handling

- Simple packet-handling rules
 - Pattern: match packet header bits

- Actions: drop, forward, modify, send to controller
- Priority: disambiguate overlapping patterns
- Counters: #bytes and #packets

- 1. src=1.2.*.*, dest=3.4.5.* → drop
- 2. src = *.*.*, dest=3.4.*.* \rightarrow forward(2)
- 3. src=10.1.2.3, dest=*.*.* \rightarrow send to controller

Unifies Different Kinds of Boxes

Router

- Match: longest destination
 IP prefix
- Action: forward out a link

• Switch

- Match: dest MAC address
- Action: forward or flood

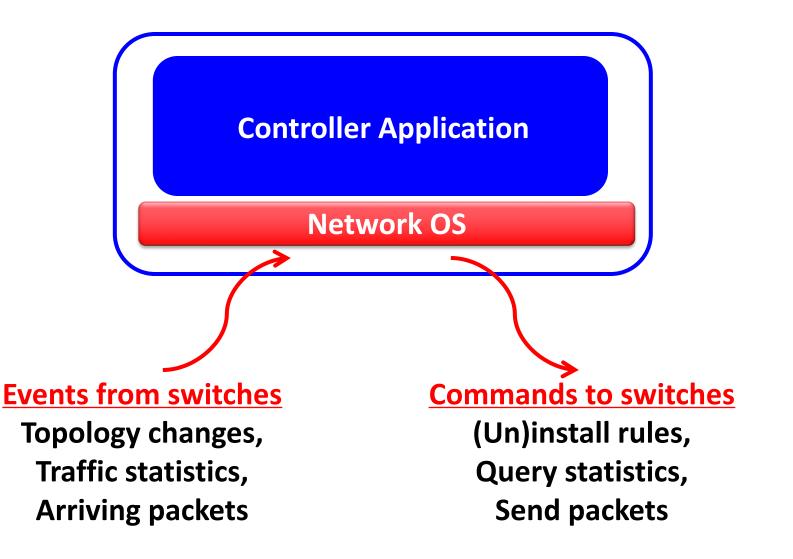

• Firewall

- Match: IP addresses and TCP
 /UDP port numbers
- Action: permit or deny

NAT

- Match: IP address and port
- Action: rewrite addr and port

Controller: Programmability

OpenFlow questions

OpenFlow designed for

(A) Inter-domain management (between)(B) Intra-domain management (within)

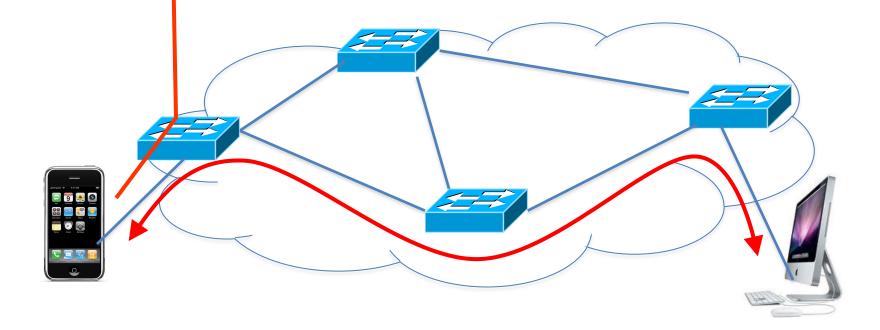

- OpenFlow API to switches open up the
 (A) RIB
 (B) FIB
- OpenFlow FIB match based on
 - (A) Exact match (e.g., MAC addresses)
 - (B) Longest prefix (e.g., IP addresses)
 - (C) It's complicated

Example OpenFlow Applications

- Dynamic access control
- Seamless mobility/migration
- Server load balancing
- Network virtualization
- Using multiple wireless access points
- Energy-efficient networking
- Adaptive traffic monitoring
- Denial-of-Service attack detection

E.g.: Dynamic Access Control

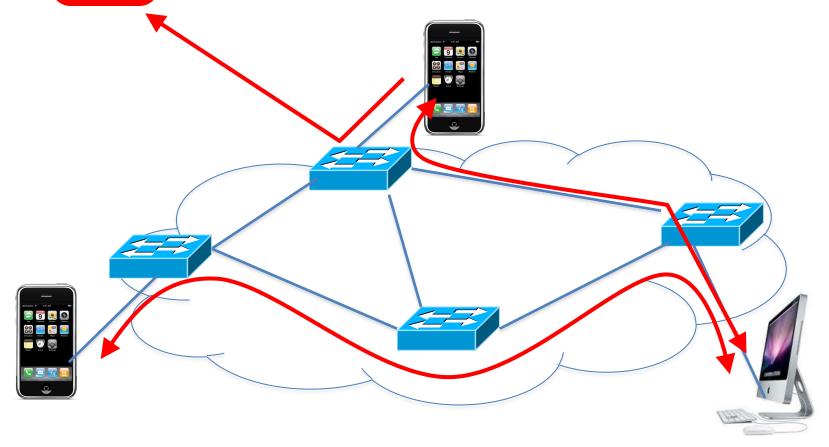

- Inspect first packet of a connection
- Consult the access control policy
- Install rules to block or route traffic

E.g.: Seamless Mobility/Migration

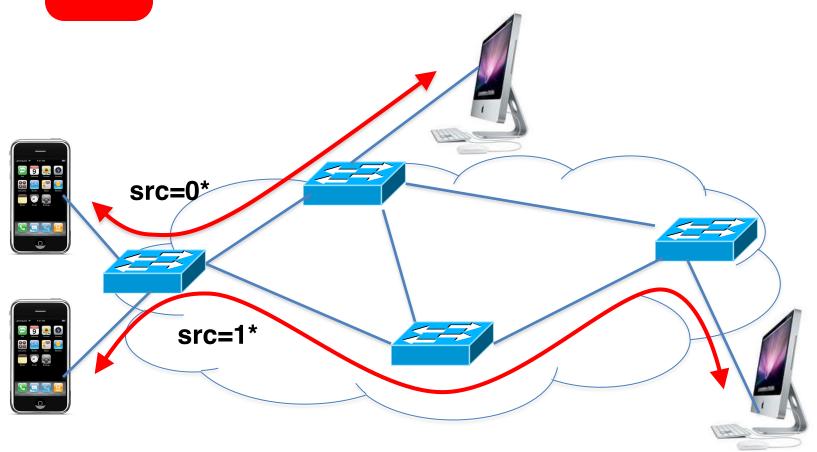

• Modify rules to reroute the traffic

E.g.: Server Load Balancing

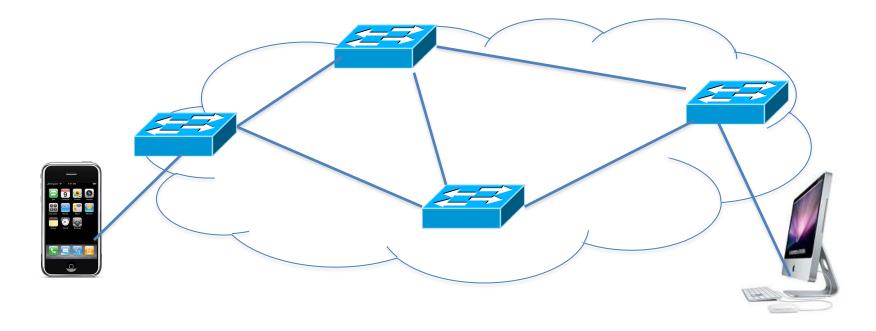

• Split traffic based on source IP

E.g.: Network Virtualization

Partition the space of packet headers

Controller and the FIB

- Forwarding rules should be added
 - (A) Proactively
 - (B) Reactively (e.g., with controller getting first packet)
 - (C) Depends on application

OpenFlow in the Wild

- Open Networking Foundation
 - Google, Facebook, Microsoft, Yahoo, Verizon, Deutsche Telekom, and many other companies
- Commercial OpenFlow switches
 - Intel, HP, NEC, Quanta, Dell, IBM, Juniper, ...
- Network operating systems
 - NOX, Beacon, Floodlight, Nettle, ONIX, POX, Frenetic
- Network deployments
 - Data centers
 - Cloud provider backbones
 - Public backbones

Programmable Data Planes

https://www.sigcomm.org/sites/default/files/ccr/papers/2014/July/0000000-0000004.pdf

In the Beginning...

• OpenFlow was simple

- A single rule table
 - Priority, pattern, actions, counters, timeouts
- Matching on any of 12 fields, e.g.,
 - MAC addresses
 - IP addresses
 - Transport protocol
 - Transport port numbers

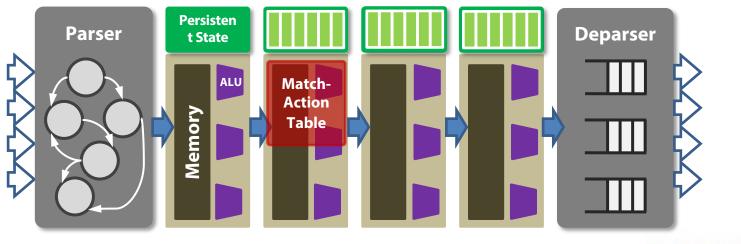

``Second System" Syndrome

- OpenFlow 1.0 limitations
 - One rule table
 - Limited headers and actions
 - Sending packets to the controller
- Later version of OpenFlow
 - More tables, headers, actions
 - But, still never enough
 - Where does it stop?!?

Version	Date	# Headers
OF 1.0	Dec '09	12
OF 1.1	Feb '11	15
OF 1.2	Dec '11	36
OF 1.3	Jun '12	40
OF 1.4	Oct '13	41

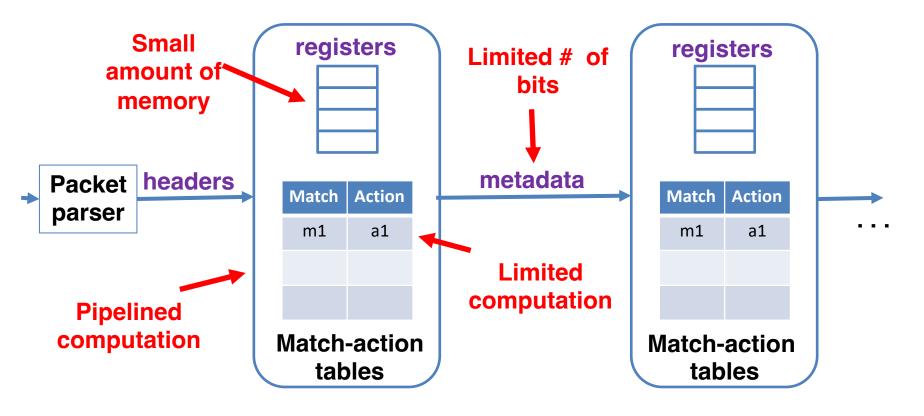

Programmable Data Planes

- Data plane designed for programmability
 - Programmable parsing
 - Typed match-action tables
 - Programmable actions
 - Storing and piggybacking metadata

Flexible, But With Constraints

Domain-specific processors: GPUs, TPUs, packet processors, ...

P4 Language (https://p4.org/)

- Protocol independence
 - Configure a packet parser
 - Define typed match+action tables
- Target independence
 - Program without knowledge of switch details
 - Rely on compiler to configure the target switch
- Reconfigurability

Change parsing and processing in the field

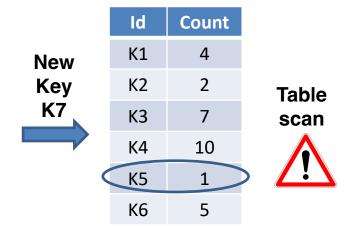

Heavy-Hitter Detection (Junior IW Project)

Vibhaa Sivamaran '17

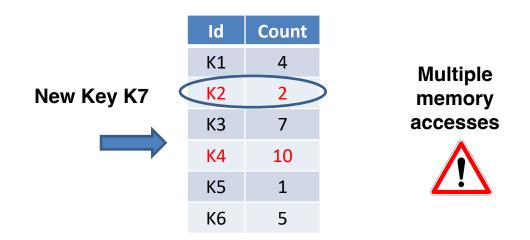

Heavy-Hitter Detection

- Heavy hitters
 - -The k largest trafic flows
 - Flows exceeding count threshold T
- Space-saving algorithm
 - -Table of (key, value) pairs
 - Evict the key with the minimum value

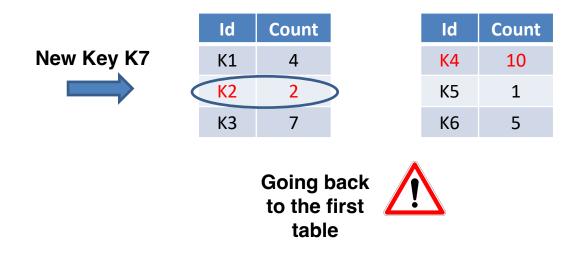

Approximating the Approximation

- Evict minimum of *d* entries
 - Rather than minimum of all entries
 - E.g., with d = 2 hash functions

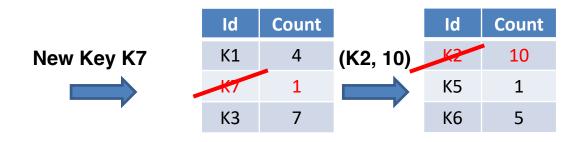

Approximating the Approximation

- Divide the table over *d* stages
 - One memory access per stage
 - Two different hash functions

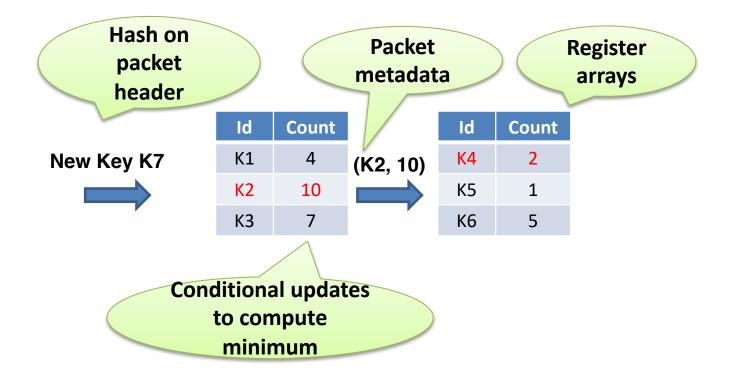

Approximating the Approximation

- Rolling minimum across stages
 - Avoid recirculating the packet
 - ... by carrying the minimum along the pipeline

P4 Prototype and Evaluation

High accuracy with overhead proportional to # of heavy hitters

Undergraduate Student Projects

OpenFlow

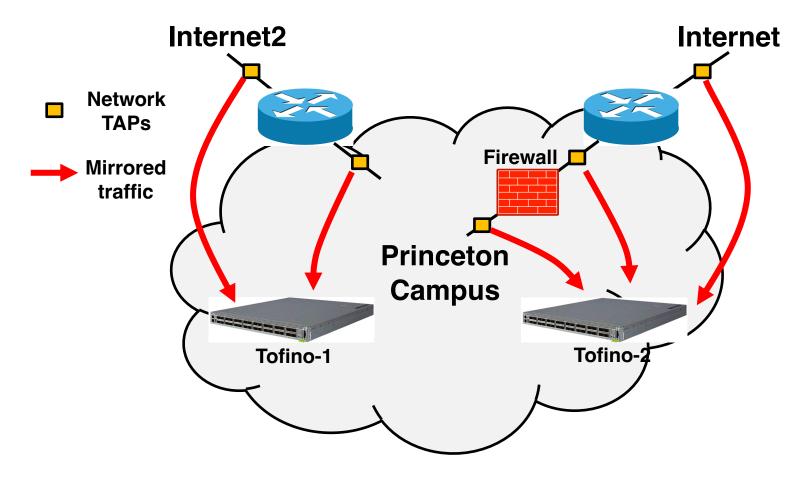

- Hierarchical heavy hitters (Lavanya Jose '12)
- Server load balancing (Dana Butnariu '13)

• P4

- Heavy-hitter detection (Vibhaa Sivaraman '17)
- Censorship circumvention (Blake Lawson '17)
- Round-trip time measurement (Mack Lee '18)
- Operating system fingerprinting (Sherry Bai '19)
- Surveillance protection (Trisha Datta '19)
- Heavy-hitters by domain name (Jason Kim '21)

Princeton Campus Deployment

(https://p4campus.cs.princeton.edu)

- Deployed: Microburst analysis, heavy hitter detection, trace anonymization
- In progress: surveillance protection, RTT, DNS heavy hitters, OS fingerprinting

Conclusion

- Rethinking networking
 - Open interfaces to the data plane
 - Separation of control and data
 - Deployment of new solutions
- Significant momentum
 - In industry and in academic research
- Next steps
 - Enterprises
 - Cellular (5G) networks
